| <b>interferenceDirection</b><br>Indicates the direction of IDC interference. Value <i>nr</i> indicates that only NR is victim of IDC interference, value <i>other</i> indicates that only another radio is victim of IDC interference and value <i>both</i> indicates that both NR and another radio are victims of IDC interference. The other radio refers to either the ISM radio or GNSS (see TR 36.816 [44]).                                                                                                                                                                      |
| <b>minSchedulingOffsetPreference</b><br>Indicates the UE's preferences on <i>minimumSchedulingOffset</i> of cross-slot scheduling for power saving.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>minSchedulingOffsetPreferenceExt</b><br>Indicates the UE's preferences on <i>minimumSchedulingOffset</i> of cross-slot scheduling for power saving for SCS 480 kHz and/or 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>multiRx-PreferenceFR2</b><br>Indicates the UE's preference on single FR2 Rx operation to address overheating or power saving. This field is allowed to be reported only when UE is configured with serving cells operating on FR2.                                                                                                                                                                                                                                                                                                                                                   |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b><i>musim-AffectedBandsList</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Indicates the UE's preference on the band(s) and/or combination(s) of bands with restricted capability for MUSIM operation. If the <i>MUSIM-CapabilityRestrictedBandParameters-r18</i> with same <i>musim-bandEntryIndex</i> appears more than once in the list of bands in a <i>MUSIM-AffectedBands</i> entry, the UE supports intra-band non-contiguous CA with restricted capability for MUSIM operation for this band. UE explicitly indicates each band and each combination of bands that are affected. The Network should respect these capability restrictions when configuring the UE with bands or band combinations that contain these bands and/or combination of bands. Fields <i>musim-MIMO-Layers-DL/UL</i> and <i>musim-SupportedBandwidth-DL/UL</i> indicate the max number of MIMO layers and max bandwidth on each CC of the band, respectively. The band(s) and/or combination(s) of bands are supported in UE capability, and the <i>musim-MIMO-Layers-DL/UL</i> and <i>musim-SupportedBandwidth-DL/UL</i> range up to the concerned maximum capability of band(s) and/or combination(s) of bands in UE capability. For each concerned band or band combination, the lowest value of each <i>musim-MIMO-Layers-DL/UL</i> / <i>musim-SupportedBandwidth-DL/UL</i> and the corresponding capabilities in the UE capability determines the supported maximum MIMO layers and maximum bandwidth for DL/UL, respectively. |
| <b><i>musim-AvoidedBandsList</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Indicates the UE's preference on band(s) and/or combination(s) of bands to be avoided for MUSIM purpose. UE explicitly indicates each band and each combination of bands to be avoided. The list may include the band of the PCell. The Network should respect these capability restrictions for the band combinations that contain these bands and/or combination of bands. The band(s) and/or combination(s) of bands is a subset of the band combination(s) in UE capability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Indicates an NR band by referring to the position of a band entry in <i>musim-CandidateBandList</i> IE. Value 1 identifies the first band in the <i>musim-CandidateBandList</i> IE, value 2 identifies the second band in the <i>musim-CandidateBandList</i> IE, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>musim-CapabilityRestricted</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Indicates the UE's preference on the temporary capability restriction on the band for MUSIM operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Indicates the UE's preferred RRC state when leaving RRC_CONNECTED.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>n3c-RelayUE-InfoList</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Information of available N3C relay UE(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>nonSDT-DataIndication</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Informs the network about the arrival of data and/or signaling mapped to radio bearers not configured for SDT while SDT procedure is ongoing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**preferredDRX-InactivityTimer**

Indicates the UE's preferred DRX inactivity timer length for power saving. Value in ms (milliSecond). *ms0* corresponds to 0, *ms1* corresponds to 1 ms, *ms2* corresponds to 2 ms, and so on. If the field is absent from the *DRX-Preference* IE, it is interpreted as the UE having no preference for the DRX inactivity timer. If secondary DRX group is configured, the *preferredDRX-InactivityTimer* only applies to the default DRX group.

**preferredDRX-LongCycle**

Indicates the UE's preferred long DRX cycle length for power saving. Value in ms. *ms10* corresponds to 10ms, *ms20* corresponds to 20 ms, *ms32* corresponds to 32 ms, and so on. If *preferredDRX-ShortCycle* is provided, the value of *preferredDRX-LongCycle* shall be a multiple of the *preferredDRX-ShortCycle* value. If the field is absent from the *DRX-Preference* IE, it is interpreted as the UE having no preference for the long DRX cycle.

**preferredDRX-ShortCycle**

Indicates the UE's preferred short DRX cycle length for power saving. Value in ms. *ms2* corresponds to 2ms, *ms3* corresponds to 3 ms, *ms4* corresponds to 4 ms, and so on. If the field is absent from the *DRX-Preference* IE, it is interpreted as the UE having no preference for the short DRX cycle.

**preferredDRX-ShortCycleTimer**

Indicates the UE's preferred short DRX cycle timer for power saving. Value in multiples of *preferredDRX-ShortCycle*. A value of 1 corresponds to *preferredDRX-ShortCycle*, a value of 2 corresponds to 2 \* *preferredDRX-ShortCycle* and so on. If the field is absent from the *DRX-Preference* IE, it is interpreted as the UE having no preference for the short DRX cycle timer. A preference for the short DRX cycle is indicated when a preference for the short DRX cycle timer is indicated.

**preferredK0**

Indicates the UE's preferred value of *k0* (slot offset between DCI and its scheduled PDSCH - see TS 38.214 [19], clause 5.1.2.1) for cross-slot scheduling for power saving. Value is defined for each subcarrier spacing (numerology) in units of slots. *s1* corresponds to 1 slot, *s2* corresponds to 2 slots, *s4* corresponds to 4 slots, and so on. If a value for a subcarrier spacing is absent, it is interpreted as the UE having no preference on *k0* for cross-slot scheduling for that subcarrier spacing. If the field is absent from the *MinSchedulingOffsetPreference* IE, it is interpreted as the UE having no preference on *k0* for cross-slot scheduling.

**preferredK2**

Indicates the UE's preferred value of *k2* (slot offset between DCI and its scheduled PUSCH - see TS 38.214 [19], clause 6.1.2.1) for cross-slot scheduling for power saving. Value is defined for each subcarrier spacing (numerology) in units of slots. *s1* corresponds to 1 slot, *s2* corresponds to 2 slots, *s4* corresponds to 4 slots, and so on. If a value for a subcarrier spacing is absent, it is interpreted as the UE having no preference on *k2* for cross-slot scheduling for that subcarrier spacing. If the field is absent from the *MinSchedulingOffsetPreference* IE, it is interpreted as the UE having no preference on *k2* for cross-slot scheduling.

**preferredRRC-State**

Indicates the UE's preferred RRC state. The value *idle* is indicated if the UE prefers to be released from RRC\_CONNECTED and transition to RRC\_IDLE. The value *inactive* is indicated if the UE prefers to be released from RRC\_CONNECTED and transition to RRC\_INACTIVE. The value *connected* is indicated if the UE prefers to revert an earlier indication to leave RRC\_CONNECTED state. The value *outOfConnected* is indicated if the UE prefers to be released from RRC\_CONNECTED and has no preferred RRC state to transition to. The value *connected* can only be indicated if the UE is configured with *connectedReporting*.

**propagationDelayDifference**

Indicates the one-way service link propagation delay difference between serving cell and each neighbour cell included in *neighCellInfoList*, defined as neighbour cell's service link propagation delay minus serving cell's service link propagation delay, in number of ms. First entry in *propagationDelayDifference* corresponds to first entry in *neighCellInfoList*, second entry in *propagationDelayDifference* corresponds to second entry in *neighCellInfoList*, and so on.

**reducedCCsDL**

Indicates the UE's preference on reduced configuration corresponding to the maximum number of downlink SCells indicated by the field, to address overheating or power saving.

When indicated to address overheating, this maximum number includes SCells of the NR MCG, PSCell and SCells of the SCG. This maximum number only includes PSCell and SCells of the SCG in (NG)EN-DC.

When indicated to address power saving, this maximum number includes PSCell and SCells of the cell group that this UE assistance information is associated with. The maximum number of downlink SCells can only range up to the current active configuration when indicated to address power savings.

**reducedCCsUL**

Indicates the UE's preference on reduced configuration corresponding to the maximum number of uplink SCells indicated by the field, to address overheating or power saving. When indicated to address overheating, this maximum number includes SCells of the NR MCG, PSCell and SCells of the SCG. This maximum number only includes PSCell and SCells of the SCG in (NG)EN-DC.

When indicated to address power saving, this maximum number includes PSCell and SCells of the cell group that this UE assistance information is associated with. The maximum number of uplink SCells can only range up to the current active configuration when indicated to address power savings.

**reducedMaxBW-FR1**

Indicates the UE's preference on reduced configuration corresponding to the maximum aggregated bandwidth across all downlink carrier(s) and across all uplink carrier(s) of FR1, to address overheating or power saving. This field is allowed to be reported only when UE is configured with serving cell(s) operating on FR1. The aggregated bandwidth across all downlink carrier(s) of FR1 is the sum of bandwidth of active downlink BWP(s) across all activated downlink carrier(s) of FR1. The aggregated bandwidth across all uplink carrier(s) of FR1 is the sum of bandwidth of active uplink BWP(s) across all activated uplink carrier(s) of FR1. If the field is absent from the *MaxBW-Preference* IE or the *OverheatingAssistance* IE, it is interpreted as the UE having no preference on the maximum aggregated bandwidth of FR1.

When indicated to address overheating, this maximum aggregated bandwidth includes carrier(s) of FR1 of both the NR MCG and the SCG. This maximum aggregated bandwidth only includes carriers of FR1 of the SCG in (NG)EN-DC. Value *mhz0* is not used when indicated to address overheating.

When indicated to address power saving, this maximum aggregated bandwidth includes carrier(s) of FR1 of the cell group that this UE assistance information is associated with. The aggregated bandwidth can only range up to the current active configuration when indicated to address power savings.

**reducedMaxBW-FR2**

Indicates the UE's preference on reduced configuration corresponding to the maximum aggregated bandwidth across all downlink carrier(s) and across all uplink carrier(s) of FR2-1, to address overheating or power saving. This field is allowed to be reported only when UE is configured with serving cell(s) operating on FR2-1. The aggregated bandwidth across all downlink carrier(s) of FR2-1 is the sum of bandwidth of active downlink BWP(s) across all activated downlink carrier(s) of FR2-1. The aggregated bandwidth across all uplink carrier(s) of FR2-1 is the sum of bandwidth of active uplink BWP(s) across all activated uplink carrier(s) of FR2-1. If the field is absent from the *MaxBW-Preference* IE or the *OverheatingAssistance* IE, it is interpreted as the UE having no preference on the maximum aggregated bandwidth of FR2-1.

When indicated to address overheating, this maximum aggregated bandwidth includes carrier(s) of FR2-1 of both the NR MCG and the NR SCG. This maximum aggregated bandwidth only includes carriers of FR2-1 of the SCG in (NG)EN-DC.

When indicated to address power saving, this maximum aggregated bandwidth includes carrier(s) of FR2-1 of the cell group that this UE assistance information is associated with. The aggregated bandwidth can only range up to the current active configuration when indicated to address power savings.

**reducedMaxBW-FR2-2**

Indicates the UE's preference on reduced configuration corresponding to the maximum aggregated bandwidth across all downlink carrier(s) and across all uplink carrier(s) of FR2-2, to address overheating or power saving. This field is allowed to be reported only when UE is configured with serving cell(s) operating on FR2-2. The aggregated bandwidth across all downlink carrier(s) of FR2-2 is the sum of bandwidth of active downlink BWP(s) across all activated downlink carrier(s) of FR2-2. The aggregated bandwidth across all uplink carrier(s) of FR2-2 is the sum of bandwidth of active uplink BWP(s) across all activated uplink carrier(s) of FR2-2. If the field is absent from the *MaxBW-PreferenceFR2-2* IE or the *OverheatingAssistance* IE, it is interpreted as the UE having no preference on the maximum aggregated bandwidth of FR2-2.

When indicated to address overheating, this maximum aggregated bandwidth includes carrier(s) of FR2-2 of both the NR MCG and the NR SCG. This maximum aggregated bandwidth only includes carriers of FR2-2 of the SCG in (NG)EN-DC.

When indicated to address power saving, this maximum aggregated bandwidth includes carrier(s) of FR2-2 of the cell group that this UE assistance information is associated with. The aggregated bandwidth can only range up to the current active configuration when indicated to address power savings.

**reducedMIMO-LayersFR1-DL**

Indicates the UE's preference on reduced configuration corresponding to the maximum number of downlink MIMO layers of each serving cell operating on FR1 indicated by the field, to address overheating or power saving. This field is allowed to be reported only when UE is configured with serving cells operating on FR1. The maximum number of downlink MIMO layers can only range up to the maximum number of MIMO layers configured across all activated downlink carrier(s) of FR1 in the cell group when indicated to address power savings.

**reducedMIMO-LayersFR1-UL**

Indicates the UE's preference on reduced configuration corresponding to the maximum number of uplink MIMO layers of each serving cell operating on FR1 indicated by the field, to address overheating or power saving (see NOTE 1). This field is allowed to be reported only when UE is configured with serving cells operating on FR1. The maximum number of uplink MIMO layers can only range up to the maximum number of MIMO layers configured across all activated uplink carrier(s) of FR1 in the cell group when indicated to address power savings.

**reducedMIMO-LayersFR2-DL**

Indicates the UE's preference on reduced configuration corresponding to the maximum number of downlink MIMO layers of each serving cell operating on FR2-1 indicated by the field, to address overheating or power saving. This field is allowed to be reported only when UE is configured with serving cells operating on FR2-1. The maximum number of downlink MIMO layers can only range up to the maximum number of MIMO layers configured across all activated downlink carrier(s) of FR2-1 in the cell group when indicated to address power savings.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Indicates the preferred amount of increment/decrement to the long DRX cycle length with respect to the current configuration. Value in number of milliseconds. Value <i>ms40</i> corresponds to 40 milliseconds, <i>msMinus40</i> corresponds to -40 milliseconds and so on.                                                                                                                                                                                                                                                                                       |
| <b>ul-GapFR2-PatternPreference</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Indicates the UE's preference on FR2 UL gap pattern as defined in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**victimSystemType**

Indicate the list of victim system types to which IDC interference is caused from NR. Value *gps*, *glonass*, *bds*, *galileo* and *navIC* indicates the type of GNSS. Value *wlan* indicates WLAN and value *bluetooth* indicates Bluetooth. Value *uwb* indicates Ultra Wide Band.

NOTE 1: The field may also indicate the UE's preference on reduced configuration corresponding to the maximum number of SRS ports (i.e. *nrofSRS-Ports*) of each serving cell operating on the associated frequency range.

**SL-TrafficPatternInfo field descriptions****messageSize**

Indicates the maximum TB size based on the observed traffic pattern. The value refers to the index of TS 38.321 [3], table 6.1.3.1-2.

**timingOffset**

This field indicates the estimated timing for a packet arrival in a sidelink logical channel. Specifically, the value indicates the timing offset with respect to subframe#0 of SFN#0 in milliseconds.

**trafficPeriodicity**

This field indicates the estimated data arrival periodicity in a sidelink logical channel. Value *ms20* corresponds to 20 ms, *ms50* corresponds to 50 ms and so on.

**UL-TrafficInfo field descriptions****burstArrivalTime**

Indicates the expected arrival time of the first packet of the Data Burst for the concerned QoS flow. If the UE provides both *burstArrivalTime* and *jitterRange*, *burstArrivalTime* is used as a reference time for the indicated jitter range.

If *burstArrivalTime* is indicated as *referenceTime*, the indicated time in 10ns unit from the origin is  $refDays * 86400 * 1000 * 100000 + refSeconds * 1000 * 100000 + refMilliSeconds * 100000 + refTenNanoSeconds$ . The *refDays* field specifies the sequential number of days (with day count starting at 0) from 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time).

If *burstArrivalTime* is indicated as *referenceSFN-AndSlot*, it refers to the UL timing of the closest SFN and slot of the PCell with the indicated number.

**jitterRange**

Indicates the maximum deviation of the arrival time of the first packet of a Data Burst compared to the time indicated with *burstArrivalTime* and the periodicity of the Data Bursts. *lowerBound* indicates the negative deviation while *upperBound* indicates the positive deviation. This field shall only be reported together with the *burstArrivalTime* or after the *burstArrivalTime* has been already reported. Value *ms0* corresponds to 0 ms, value *0dot5* to 0.5 ms, value *ms1* to 1 ms and so on. Value *beyondMs7* indicates the jitter bound is higher than 7 ms. Value 0 ms means there is no Data Burst arrival time deviation from the indicated *burstArrivalTime*.

**pdu-SetIdentification**

Indicates whether the UE is able to identify PDU Set(s) for the QoS flow. If set to *true*, the UE is able to identify PDU Set(s) for the associated QoS flow, otherwise, the UE is not able to do so. Before receiving this indication, the network assumes the value is set to *false*.

**psi-Identification**

Indicates whether the UE is able to identify PSI(s) for the QoS flow. This field shall only be set to *true* if *pdu-SetIdentification* is also set to *true* (or was set to *true* previously for the same QoS flow). If set to *true*, the UE is able to identify PSI(s) for the associated QoS flow, otherwise, the UE is not able to do so. Before receiving this indication, the network assumes the value is set to *false*.

**qfi**

Identity of the QoS flow to which this UL traffic information refers.

**trafficPeriodicity**

Indicates the average time period between the start times of two data bursts, expressed in the number of microseconds.

## – *UECapabilityEnquiry*

The *UECapabilityEnquiry* message is used to request UE radio access capabilities for NR as well as for other RATs.

Signalling radio bearer: SRB1

| <b><i>allPreamblesBlocked</i></b><br>This field is included when the all the preamble transmission attempts in the corresponding beam (SSB or CSI-RS) are blocked by failed LBT.                                                                                                                                                                                                                                                                                                                                                |
| <b><i>attemptedBWP-InfoList</i></b><br>This field indicates <i>locationAndBandwidth</i> and <i>subcarrierSpacing</i> of all the bandwidth parts in which the consistent LBT failures are triggered at the moment of successful RA completion.                                                                                                                                                                                                                                                                                   |
| <b><i>locationAndBandwidth</i></b><br>Frequency domain location and bandwidth of the bandwidth part associated to the random-access resources used by the UE or of the bandwidth part in which the consistent LBT failures is triggered and not cancelled prior to successful completion of random access procedure (if this field is included in <i>attemptedBWP-InfoList</i> ) or prior to RLF/HOF (if this field is included in <i>attemptedBWP-InfoList</i> or <i>bwp-Info</i> ).                                           |
| <b><i>numberOfLBT-Failures</i></b><br>This field is used to indicate the total number of preamble transmission attempts for which LBT failure indication is received in the RA procedure. If the number of LBT failure indications received from lower layers during the RA procedure exceeds or equals to 128, UE sets the field to 128. This field is optional present when there is at least one preamble transmission attempt for which LBT failure indication is received during the RA procedure, otherwise it is absent. |
| <b><i>numberOfPreamblesPerSSB-ForThisPartition</i></b><br>This field determines how many consecutive preambles are associated to the used feature or combination of features starting from the starting preamble(s) per SSB.                                                                                                                                                                                                                                                                                                    |
| <b><i>perRAInfoList</i>, <i>perRAInfoList-v1660</i></b><br>This field provides detailed information about each of the random access attempts in the chronological order of the random access attempts. If <i>perRAInfoList-v1660</i> is present, it shall contain the same number of entries, listed in the same order as in <i>perRAInfoList-r16</i> .                                                                                                                                                                         |
| <b><i>startPreambleForThisPartition</i></b><br>This field indicates the first preamble associated with the used feature or combination of features.                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>subcarrierSpacing</i></b><br>Subcarrier spacing used in the bandwidth part associated to the random-access resources used by the UE or of the bandwidth part in which the consistent LBT failures is triggered and not cancelled prior to successful completion of random access procedure (if this field is included in <i>attemptedBWP-InfoList</i> ) or prior to RLF/HOF (if this field is included in <i>attemptedBWP-InfoList</i> or <i>bwp-Info</i> ).                                                              |
| <b><i>triggeredFeatureCombination</i></b><br>One or more features (e.g., <i>RedCap</i> , <i>Slicing</i> , <i>SDT</i> and <i>MSG3 repetition</i> ) that triggers the random-access procedure. When triggered feature is <i>Slicing</i> , UE includes all the S-NSSAIs associated to the slices triggering the access attempt in the random-access procedure.                                                                                                                                                                     |
| <b><i>usedFeatureCombination</i></b><br>The feature or combination of features (e.g., <i>redCap</i> , <i>smallData</i> , <i>nsag</i> and <i>msg3-Repetitions</i> ) associated to the used random-access resources as specified in TS 38.321[3].                                                                                                                                                                                                                                                                                 |

| RA-Report field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>cellID</b><br>This field indicates the CGI of the cell in which the associated random access procedure was performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>contentionDetected</b><br>This field is used to indicate that contention was detected for the transmitted preamble in the given random access attempt or not. This field is not included when the UE performs random access attempt is using contention free random-access resources or when the <i>raPurpose</i> is set to <i>requestForOtherSI</i> or when the RA attempt is a 2-step RA attempt and fallback to 4-step RA did not occur (i.e. <i>fallbackToFourStepRA</i> is not included).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>csi-RS-Index, csi-RS-Index-v1660</b><br>This field is used to indicate the CSI-RS index corresponding to the random access attempt.<br>If the random access procedure is for beam failure recovery, the field indicates the NZP-CSI-RS-ResourceId. For CSI-RS index larger than maxNrofCSI-RS-ResourcesRRM-1, the index value is the sum of csi-RS-Index (without suffix) and csi-RS-Index-v1660.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>dlPathlossRSRP</b><br>Measured RSRP of the DL pathloss reference obtained at the time of <i>RA_Type</i> selection stage of the RA procedure as captured in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>dlRSRPAboveThreshold</b><br>In 4 step random access procedure, this field is used to indicate whether the DL beam (SSB) quality associated to the random access attempt was above or below the threshold <i>rsrp-ThresholdSSB</i> in <i>beamFailureRecoveryConfig</i> in UL BWP configuration of UL BWP selected for random access procedure initiated for beam failure recovery. Otherwise, if the UE has received <i>rsrp-ThresholdSSB-r17</i> in <i>FeatureCombinationPreambles</i> used for the feature specific random access, the field is used to indicate whether DL beam (SSB) quality associated to the random access attempt was above or below this <i>rsrp-ThresholdSSB-r17</i> ; else, if <i>rsrp-ThresholdSSB-r17</i> is not included in <i>FeatureCombinationPreambles</i> used for the feature specific random access, this field is used to indicate whether DL beam (SSB) quality associated to the random access attempt was above or below <i>rsrp-ThresholdSSB</i> included in the <i>RACH-ConfigCommon</i> which includes this <i>FeatureCombinationPreambles</i> ; else, this field is used to indicate whether DL beam (SSB) quality associated to the random access attempt was above or below <i>rsrp-ThresholdSSB</i> in <i>rach-ConfigCommon</i> in UL BWP configuration of UL BWP selected for random access procedure.<br>In 2 step random access procedure, if the UE has received <i>rsrp-ThresholdSSB-r17</i> in <i>FeatureCombinationPreambles</i> used for the feature specific random access, the field is used to indicate whether DL beam (SSB) quality associated to the random access attempt was above or below this <i>rsrp-ThresholdSSB-r17</i> ; else, if <i>rsrp-ThresholdSSB-r17</i> is not included in <i>FeatureCombinationPreambles</i> used for the feature specific random access, this field is used to indicate whether the DL beam (SSB) quality associated to the random access attempt was above or below the threshold <i>msgA-RSRP-ThresholdSSB</i> included in the <i>RACH-ConfigCommonTwoStepRA</i> which includes this <i>FeatureCombinationPreambles</i> ; else, this field is used to indicate whether the DL beam (SSB) quality associated to the random access attempt was above or below the threshold <i>msgA-RSRP-ThresholdSSB</i> in <i>rach-ConfigCommonTwoStepRA</i> in UL BWP configuration of UL BWP selected for random access procedure. |
| <b>fallbackToFourStepRA</b><br>This field indicates if a fallback indication in MsgB is received (according to TS 38.321 [3]) for the 2-step random access attempt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>intendedSIBs</b><br>This field indicates the SIB(s) the UE wanted to receive as a result of the on demand SI request (when the RA procedure is a used as a SI request) initiated by the UE. That is, it indicates the one(s) of the SIB(s) in the SI message(s) requested to be broadcast that the UE was interested in. Value <i>posSIB</i> indicates that the UE wanted to receive one or more positioning SIB(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>lbt-Detected</b><br>This field is included when there is at least one LBT failure indication received prior to change of beam for preamble transmission during RA procedure, otherwise this field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| This field indicates the lowest resource block of the contention based random-access resources for 2-step CBRA in the random-access procedure. The indication has the form of the offset of the lowest PRACH transmissions occasion with respect to PRB 0 in the frequency domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

This field is mandatory present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>raPurpose</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| This field is used to indicate the RA scenario for which the RA report entry is triggered. The RA accesses associated to Initial access from RRC_IDLE, RRC re-establishment procedure, transition from RRC-INACTIVE. The indicator <i>beamFailureRecovery</i> is used in case of successful beam failure recovery related RA procedure in the SpCell [3]. The indicator <i>reconfigurationWithSync</i> is used if the UE executes a reconfiguration with sync. The indicator <i>ulUnSynchronized</i> is used if the random access procedure is initiated in a SpCell by DL or UL data arrival during RRC_CONNECTED when the timeAlignmentTimer is not running in the PTAG or if the RA procedure is initiated in a serving cell by a PDCCH order [3]. The indicator <i>schedulingRequestFailure</i> is used in case of SR failures [3]. The indicator <i>noPUCCHResourceAvailable</i> is used when the UE has no valid SR PUCCH resources configured [3]. The indicator <i>requestForOtherSI</i> is used for MSG1 based on demand SI request. The indicator <i>msg3RequestForOtherSI</i> is used in case of MSG3 based SI request. The indication <i>lbtFailure</i> is used when the UE initiates RACH in SpCell due to consistent uplink LBT failures [3]. The field can also be used for the SCG-related RA-Report when the <i>raPurpose</i> is set to <i>beamFailureRecovery</i> , <i>reconfigurationWithSync</i> , <i>ulUnSynchronized</i> , <i>schedulingRequestFailure</i> , <i>noPUCCHResourceAvailable</i> and <i>lbtFailure</i> . |

| This field is included when the RA report entry is included because of SDT and if the SDT transmission failed. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>spCellID</b><br>This field is used to indicate the CGI of the SpCell of the cell group associated to the SCell in which the associated random access procedure was performed. If the UE performs RA procedure on a SCell associated to the MCG, then this field is set to the CGI of the PCell and if the UE performs RA procedure on a SCell associated to the SCG, then this field is set to the CGI of the PSCell. If the CGI of the PSCell is not available at the UE for the RA procedure performed on a SCell associated to the SCG or for the RA procedure on the PSCell, this field is set to the CGI of the PCell. Otherwise, the field is absent. |
| <b>ssb-Index</b><br>This field is used to indicate the SS/PBCH index of the SS/PBCH block corresponding to the random access attempt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ssbsForSI-Acquisition</b><br>This field indicates the SSB(s) (in the form of SSB index(es)) that the UE used to receive the requested SI message(s). The field is present if the purpose of the random access procedure was to request on-demand SI (i.e. if the <i>raPurpose</i> is set to <i>requestForOtherSI</i> or <i>msg3RequestForOtherSI</i> ). Otherwise, the field is absent.                                                                                                                                                                                                                                                                     |

| <i>RLF-Report</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b><i>bwp-Info</i></b><br>This field is used to indicate the BWP information in which the UE detected consistent uplink LBT failure. This field is set only when the detected consistent uplink LBT failure did not trigger the random access procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>choCandidateCellList</i></b><br>This field is used to indicate the list of candidate target cells for conditional handover included in <i>condRRCReconfig</i> at the time of connection failure. The field does not include the candidate target cells included in <i>measResultNeighCells</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>choCellId</i></b><br>This field is used to indicate the candidate target cell for conditional handover included in <i>condRRCReconfig</i> that the UE selected for CHO based recovery while T311 is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>connectionFailureType</i></b><br>This field is used to indicate whether the connection failure is due to radio link failure or handover failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>csi-rsRLMConfigBitmap</i>, <i>csi-rsRLMConfigBitmap-v1650</i></b><br>These fields are used to indicate the CSI-RS indexes configured in the RLM configurations for the active BWP when the UE declares RLF or HOF. The UE first fills in the <i>csi-rsRLMConfigBitmap-r16</i> to indicate the first 96 CSI-RS indexes and then <i>csi-rsRLMConfigBitmap-v1650</i> to indicate the latter 96 CSI-RS indexes. The first/leftmost bit in <i>csi-rsRLMConfigBitmap-r16</i> corresponds to CSI-RS index 0, the second bit corresponds to CSI-RS index 1. The first/leftmost bit in <i>csi-rsRLMConfigBitmap-v1650</i> corresponds to CSI-RS index 96, the second bit corresponds to CSI-RS index 97. These fields are included only if the <i>RadioLinkMonitoringConfig</i> for the respective BWP is configured. |
| <b><i>c-RNTI</i></b><br>This field indicates the C-RNTI used in the PCell upon detecting radio link failure or the C-RNTI used in the source PCell upon handover failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>elapsedTimeSCG-Failure</i></b><br>This field is used to indicate the time elapsed between the SCG failure and the MCG failure. The maximum value <i>1023</i> means 1023ms or longer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>elapsedTimeT316</i></b><br>This field is used to indicate the value of the elapsed time of the timer T316. Value in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>failedPCellId</i></b><br>This field is used to indicate the PCell in which RLF is detected or the target PCell of the failed handover. For intra-NR handover <i>nrFailedPCellId</i> is included and for the handover from NR to EUTRA <i>eutraFailedPCellId</i> is included. The UE sets the ARFCN according to the frequency band used for transmission/ reception when the failure occurred.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>failedPCellId-EUTRA</i></b><br>This field is used to indicate the PCell in which RLF is detected or the source PCell of the failed handover in an E-UTRA RLF report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>lastHO-Type</i></b><br>This field is used to indicate the type of the last executed handover before the last detected connection failure. The field is set to <i>cho</i> if the last executed handover was initiated by a conditional reconfiguration execution. The field is set to <i>daps</i> if the last executed handover was a DAPS handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mcg-RecoveryFailureCause</i></b><br>This field is used to indicate the cause of the fast MCG recovery failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| ULDedicatedMessageSegment field descriptions |                                                                                                                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentNumber</b>                         | Identifies the sequence number of a segment within the encoded UL DCCH message.                                                                                                                                           |
| <b>rrc-MessageSegmentContainer</b>           | Includes a segment of the encoded UL DCCH message. The size of the included segment in this container should be small enough that the resulting encoded RRC message PDU is less than or equal to the PDCP SDU size limit. |
| <b>rrc-MessageSegmentType</b>                | Indicates whether the included UL DCCH message segment is the last segment or not.                                                                                                                                        |

– *ULInformationTransfer*

The *ULInformationTransfer* message is used for the uplink transfer of NAS or non-3GPP dedicated information, or IAB-DU specific F1-C related information.

Signalling radio bearer: SRB2 or SRB1 (only if SRB2 not established yet). If SRB2 is suspended, the UE does not send this message until SRB2 is resumed. If only *dedicatedInfoF1c* is included, SRB2 is used.

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to network

## 6.3 RRC information elements

### 6.3.0 Parameterized types

#### – *SetupRelease*

*SetupRelease* allows the *ElementTypeParam* to be used as the referenced data type for the setup and release entries. See A.3.8 for guidelines.

```
-- ASN1START
-- TAG-SETUPRELEASE-START

SetupRelease { ElementTypeParam } ::= CHOICE {
    release      NULL,
    setup        ElementTypeParam
}

-- TAG-SETUPRELEASE-STOP
-- ASN1STOP
```

### 6.3.1 System information blocks

#### – *SIB2*

*SIB2* contains cell re-selection information common for intra-frequency, inter-frequency and/or inter-RAT cell re-selection (i.e. applicable for more than one type of cell re-selection but not necessarily all) as well as intra-frequency cell re-selection information other than neighbouring cell related.

#### ***SIB2* information element**

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absThreshSS-BlocksConsolidation</i></b><br>Threshold for consolidation of L1 measurements per RS index. If the field is absent, the UE uses the measurement quantity as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>cellEdgeEvaluation</i></b><br>Indicates the criteria for a UE to detect that it is not at cell edge, in order to relax measurement requirements for cell reselection (see TS 38.304 [20], clause 5.2.4.9.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>cellEdgeEvaluationWhileStationary</i></b><br>Indicates the criteria for a UE to detect that it is not at cell edge while stationary, in order to relax measurement requirements for cell reselection (see TS 38.304 [20], clause 5.2.4.9.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>cellEquivalentSize</i></b><br>The number of cell count used for mobility state estimation for this cell as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>cellReselectionInfoCommon</i></b><br>Cell re-selection information common for intra-frequency, inter-frequency and/ or inter-RAT cell re-selection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>cellReselectionServingFreqInfo</i></b><br>Information common for non-intra-frequency cell re-selection i.e. cell re-selection to inter-frequency and inter-RAT cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>combineRelaxedMeasCondition</i></b><br>When both <i>lowMobilityEvaluation</i> and <i>cellEdgeEvaluation</i> criteria are present in SIB2, this parameter configures the UE to fulfil both criteria in order to relax measurement requirements for cell reselection. If the field is absent, the UE is allowed to relax measurement requirements for cell reselection when either or both of the criteria are met. (See TS 38.304 [20], clause 5.2.4.9.0)                                                                                                                                                                                                                                                                                                            |
| <b><i>combineRelaxedMeasCondition2</i></b><br>When both <i>stationaryMobilityEvaluation</i> and <i>cellEdgeEvaluationWhileStationary</i> criteria are present in SIB2, this parameter configures the UE to fulfil both criteria in order to relax measurement requirements for cell reselection. If the field is absent, the UE is allowed to relax measurement requirements for cell reselection when only the stationary criteria is met. (See TS 38.304 [20], clause 5.2.4.9.0)                                                                                                                                                                                                                                                                                        |
| <b><i>deriveSSB-IndexFromCell</i></b><br>This field indicates whether the UE can utilize serving cell timing to derive the index of SS block transmitted by neighbour cell. If this field is set to <i>true</i> , the UE assumes SFN and frame boundary alignment across cells on the serving frequency as specified in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>frequencyBandList</i></b><br>Indicates the list of frequency bands for which the NR cell reselection parameters apply. The UE behaviour in case the field is absent is described in clause 5.2.2.4.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>frequencyBandListAerial</i></b><br>Indicates the list of frequency bands for aerial operation for which the NR cell reselection parameters apply. The UE behaviour in case the field is absent is described in clause 5.2.2.4.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>highPriorityMeasRelax</i></b><br>Indicates whether measurements can be relaxed on high priority frequencies. If the field is absent, the UE shall not relax measurements on high priority frequencies beyond "T <sub>higher_priority_search</sub> " unless both low mobility and not at cell edge criteria are fulfilled (see TS 38.133 [14], clauses 4.2.2.7, 4.2.2.10 and 4.2.2.11).                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>intraFreqCellReselectionInfo</i></b><br>Cell re-selection information common for intra-frequency cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>lowMobilityEvaluation</i></b><br>Indicates the criteria for a UE to detect low mobility, in order to relax measurement requirements for cell reselection (see TS 38.304 [20], clause 5.2.4.9.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>nrofSS-BlocksToAverage</i></b><br>Number of SS blocks to average for cell measurement derivation. If the field is absent the UE uses the measurement quantity as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>p-Max</i></b><br>Value in dBm applicable for the intra-frequency neighbouring NR cells. If absent the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if <i>p-Max</i> is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79]. |
| <b><i>q-Hyst</i></b><br>Parameter "Q <sub>hyst</sub> " in TS 38.304 [20], Value in dB. Value <i>dB1</i> corresponds to 1 dB, <i>dB2</i> corresponds to 2 dB and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| SIB2 field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>smtc</b><br>Measurement timing configuration for intra-frequency measurement. If this field is absent, the UE assumes that SSB periodicity is 5 ms for the intra-frequency cells. If the field is broadcast by an NTN cell, the <i>offset</i> (derived from parameter <i>periodicityAndOffset</i> ) is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual <i>offset</i> based on the actual propagation delay difference.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>smtc2-LP</b><br>Measurement timing configuration for intra-frequency neighbour cells with a Long Periodicity (LP) indicated by periodicity in <i>smtc2-LP</i> . The timing offset and duration are equal to the offset and duration indicated in <i>smtc</i> in <i>intraFreqCellReselectionInfo</i> . The periodicity in <i>smtc2-LP</i> can only be set to a value strictly larger than the periodicity in <i>smtc</i> in <i>intraFreqCellReselectionInfo</i> (e.g. if <i>smtc</i> indicates sf20 the Long Periodicity can only be set to sf40, sf80 or sf160, if <i>smtc</i> indicates sf160, <i>smtc2-LP</i> cannot be configured). The <i>pci-List</i> , if present, includes the physical cell identities of the intra-frequency neighbour cells with Long Periodicity. If <i>smtc2-LP</i> is absent, the UE assumes that there are no intra-frequency neighbour cells with a Long Periodicity. This field is not configured together with <i>smtc4list</i> . |
| <b>smtc4list</b><br>Measurement timing configuration list for NTN deployments. The offset of each SSB-MTC4 in <i>smtc4list</i> is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual <i>offset</i> based on the actual propagation delay difference. For a UE that supports less SMTCs than what is included in this list, it is up to the UE to select which SMTCs to consider.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| SIB2 field descriptions                                                                                                                                                                                       |

### SIB3

SIB3 contains neighbouring cell related information relevant only for intra-frequency cell re-selection. The IE includes cells with specific re-selection parameters as well as exclude-listed cells.

**SIB3 information element**

| <b>SIB3 field descriptions</b>     |                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channelAccessMode2</b>          | If present, this field indicates that intra-frequency neighbor cells apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the intra-frequency neighbor cells do not apply any channel access procedure. |
| <b>intraFreqAllowedCellList</b>    | List of allow-listed intra-frequency neighbouring cells, see TS 38.304 [20], clause 5.2.4.                                                                                                                                                                                                                    |
| <b>intraFreqCAG-CellList</b>       | List of intra-frequency neighbouring CAG cells (as defined in TS 38.304 [20]) per PLMN.                                                                                                                                                                                                                       |
| <b>intraFreqExcludedCellList</b>   | List of exclude-listed intra-frequency neighbouring cells.                                                                                                                                                                                                                                                    |
| <b>intraFreqNeighCellList</b>      | List of intra-frequency neighbouring cells with specific cell re-selection parameters. If <i>intraFreqNeighCellList-v1610</i> is present, it shall contain the same number of entries, listed in the same order as in <i>intraFreqNeighCellList</i> (without suffix).                                         |
| <b>intraFreqNeighHSDN-CellList</b> | List of intra-frequency neighbouring HSDN cells as specified in TS 38.304 [20].                                                                                                                                                                                                                               |
| <b>plmn-IdentityIndex</b>          | Index of the PLMN across the <i>plmn-IdentityInfoList</i> and <i>npr-IdentityInfoList</i> fields included in SIB1.                                                                                                                                                                                            |
| <b>q-OffsetCell</b>                | Parameter "Qoffset <sub>s,n</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                        |
| <b>q-QualMinOffsetCell</b>         | Parameter "Q <sub>qualminoffsetcell</sub> " in TS 38.304 [20]. Actual value Q <sub>qualminoffsetcell</sub> = field value [dB].                                                                                                                                                                                |
| <b>q-RxLevMinOffsetCell</b>        | Parameter "Q <sub>rxlevminoffsetcell</sub> " in TS 38.304 [20]. Actual value Q <sub>rxlevminoffsetcell</sub> = field value * 2 [dB].                                                                                                                                                                          |
| <b>q-RxLevMinOffsetCellSUL</b>     | Parameter "Q <sub>rxlevminoffsetcellSUL</sub> " in TS 38.304 [20]. Actual value Q <sub>rxlevminoffsetcellSUL</sub> = field value * 2 [dB].                                                                                                                                                                    |
| <b>ssb-PositionQCL</b>             | Indicates the QCL relation between SS/PBCH blocks for a specific intra-frequency neighbor cell as specified in TS 38.213 [13], clause 4.1. If provided, the cell specific value overwrites the value signalled by <i>ssb-PositionQCL-Common</i> in <i>SIB2</i> for the indicated cell.                        |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                             |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SharedSpectrum2</i>      | The field is optional present, Need R, if this intra-frequency or neighbor cell operates with shared spectrum channel access. Otherwise, it is absent, Need R. |

## — SIB4

*SIB4* contains information relevant for inter-frequency cell re-selection (i.e. information about other NR frequencies and inter-frequency neighbouring cells relevant for cell re-selection), which can also be used for NR idle/inactive measurements. The IE includes cell re-selection parameters common for a frequency as well as cell specific re-selection parameters.

| <b>SIB4 field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absThreshSS-BlocksConsolidation</i></b><br>Threshold for consolidation of L1 measurements per RS index. If the field is absent, the UE uses the measurement quantity as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>accessAllowed2RxXR</i></b><br>Indicates if the cells on the frequency support 2Rx XR UEs. If present, 2Rx XR UEs shall consider only these NR frequencies in cell reselection evaluation.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>channelAccessMode2</i></b><br>If present, this field indicates that the neighbor cells on the inter-frequency apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the neighbor cells on the inter-frequency do not apply any channel access procedure.                                                                                                                                                                                                                                                                                      |
| <b><i>deriveSSB-IndexFromCell</i></b><br>This field indicates whether the UE may use the timing of any detected cell on that frequency to derive the SSB index of all neighbour cells on that frequency. If this field is set to <i>true</i> , the UE assumes SFN and frame boundary alignment across cells on the neighbor frequency as specified in TS 38.133 [14].                                                                                                                                                                                                                                                                                    |
| <b><i>dl-CarrierFreq</i></b><br>This field indicates center frequency of the SS block of the neighbour cells, where the frequency corresponds to a GSCN value as specified in TS 38.101-1 [15] or TS 38.101-5 [75].<br>For a neighbouring carrier frequency when <i>dl-CarrierFreq-r18</i> is included, the network sets the corresponding value of <i>dl-CarrierFreq</i> (without suffix) to 250, and the UE applies <i>dl-CarrierFreq-r18</i> instead of <i>dl-CarrierFreq</i> (without suffix). In such case, if the UE does not support the GSCN value corresponding to the <i>dl-CarrierFreq-r18</i> , it ignores the corresponding neighbour cell. |
| <b><i>eRedCapAccessAllowed</i></b><br>Indicates whether eRedCap UEs are allowed to access cells on the frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>frequencyBandList</i></b><br>Indicates the list of frequency bands for which the NR cell reselection parameters apply. For a neighbouring carrier frequency when <i>frequencyBandList-r18</i> is included, the network sets the corresponding value of <i>freqBandIndicatorNR</i> in <i>frequencyBandList</i> (without suffix) to 200, and the UE applies <i>frequencyBandList-r18</i> instead of <i>frequencyBandList</i> (without suffix).                                                                                                                                                                                                       |
| <b><i>frequencyBandListAerial</i></b><br>Indicates the list of frequency bands for aerial operation for which the NR cell reselection parameters apply. The UE behaviour in case the field is absent is described in clause 5.2.2.4.5.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>highSpeedMeasInterFreq</i></b><br>If the field is set to <i>true</i> and UE supports high speed inter-frequency IDLE/INACTIVE measurements, the UE shall apply the enhanced inter-frequency RRM requirements on the inter-frequency carrier to support high speed up to 500 km/h in RRC_IDLE/RRC_INACTIVE as specified in TS 38.133 [14].                                                                                                                                                                                                                                                                                                          |
| <b><i>interFreqAllowedCellList</i></b><br>List of allow-listed inter-frequency neighbouring cells, see TS 38.304 [20], clause 5.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>interFreqCAG-CellList</i></b><br>List of inter-frequency neighbouring CAG cells (as defined in TS 38.304 [20] per PLMN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>interFreqCarrierFreqList</i></b><br>List of neighbouring carrier frequencies and frequency specific cell re-selection information. If <i>interFreqCarrierFreqList-v1610</i> , <i>interFreqCarrierFreqList-v1700</i> , <i>interFreqCarrierFreqList-v1720</i> , <i>interFreqCarrierFreqList-v1730</i> , <i>interFreqCarrierFreqList-v1760</i> or <i>interFreqCarrierFreqList-v1800</i> are present, they shall contain the same number of entries, listed in the same order as in <i>interFreqCarrierFreqList</i> (without suffix).                                                                                                                  |
| <b><i>interFreqExcludedCellList</i></b><br>List of exclude-listed inter-frequency neighbouring cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>interFreqNeighCellList</i></b><br>List of inter-frequency neighbouring cells with specific cell re-selection parameters. If <i>interFreqNeighCellList-v1610</i> is present, it shall contain the same number of entries, listed in the same order as in <i>interFreqNeighCellList</i> (without suffix).                                                                                                                                                                                                                                                                                                                                            |
| <b><i>interFreqNeighHSDN-CellList</i></b><br>List of inter-frequency neighbouring HSDN cells as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>mobileIAB-CellList</i></b><br>Contains a PCI range on which mobile IAB cells may be deployed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>nrofSS-BlocksToAverage</b><br>Number of SS blocks to average for cell measurement derivation. If the field is absent, the UE uses the measurement quantity as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>plmn-IdentityIndex</b><br>Index of the PLMN across the <i>plmn-IdentityInfoList</i> and <i>npn-IdentityInfoList</i> fields included in SIB1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>p-Max</b><br>Value in dBm applicable for the neighbouring NR cells on this carrier frequency. If absent the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if <i>p-Max</i> is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79].                                                                                                                                                                                  |
| <b>q-OffsetCell</b><br>Parameter "Qoffset <sub>s,n</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>smtc</b><br>Measurement timing configuration for inter-frequency measurement. If this field is absent, the UE assumes that SSB periodicity is 5 ms in this frequency. If the field is broadcast by an NTN cell, the <i>offset</i> (derived from parameter <i>periodicityAndOffset</i> ) is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual <i>offset</i> based on the actual propagation delay difference.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>smtc2-LP</b><br>Measurement timing configuration for inter-frequency neighbour cells with a Long Periodicity (LP) indicated by periodicity in <i>smtc2-LP</i> . The timing offset and duration are equal to the offset and duration indicated in <i>smtc</i> in <i>InterFreqCarrierFreqInfo</i> . The periodicity in <i>smtc2-LP</i> can only be set to a value strictly larger than the periodicity in <i>smtc</i> in <i>InterFreqCarrierFreqInfo</i> (e.g. if <i>smtc</i> indicates sf20 the Long Periodicity can only be set to sf40, sf80 or sf160, if <i>smtc</i> indicates sf160, <i>smtc2-LP</i> cannot be configured). The <i>pci-List</i> , if present, includes the physical cell identities of the inter-frequency neighbour cells with Long Periodicity. If <i>smtc2-LP</i> is absent, the UE assumes that there are no inter-frequency neighbour cells with a Long Periodicity. This field is not configured together with <i>smtc4list</i> . |
| <b>smtc4list</b><br>Measurement timing configuration list for NTN deployments. The offset of each SSB-MTC4 in <i>smtc4list</i> is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual <i>offset</i> based on the actual propagation delay difference. For a UE that supports less SMTCs than what is included in this list, it is up to the UE to select which SMTCs to consider.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LessThan5MHz</i>         | The field is mandatory present if the <i>carrierBandwidth</i> in <i>SIB1</i> indicates UL or DL transmission bandwidth other than 15 PRB and the corresponding neighbour cell(s) support(s) 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Otherwise, the field is optional, Need R. |
| <i>Mandatory</i>            | The field is mandatory present in <i>SIB4</i> .                                                                                                                                                                                                                                                                                                                        |
| <i>RSRQ</i>                 | The field is mandatory present if <i>threshServingLowQ</i> is present in <i>SIB2</i> ; otherwise it is absent.                                                                                                                                                                                                                                                         |
| <i>SharedSpectrum</i>       | This field is mandatory present if this inter-frequency operates with shared spectrum channel access. Otherwise, it is absent, Need R.                                                                                                                                                                                                                                 |
| <i>SharedSpectrum2</i>      | The field is optional present, Need R, if this inter-frequency or neighbor cell operates with shared spectrum channel access. Otherwise, it is absent, Need R.                                                                                                                                                                                                         |

## – SIB5

*SIB5* contains information relevant only for inter-RAT cell re-selection i.e. information about E-UTRA frequencies and E-UTRAs neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency.

— SIB9

SIB9 contains information related to GPS time and Coordinated Universal Time (UTC). The UE may use the parameters provided in this system information block to obtain the UTC, the GPS and the local time.

NOTE: The UE may use the time information for numerous purposes, possibly involving upper layers e.g. to assist GPS initialisation, to synchronise the UE clock.

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dayLightSavingTime</b><br>Indicates if and how daylight-saving time (DST) is applied to obtain the local time. The semantics are the same as the semantics of the <i>Daylight Saving Time</i> IE in TS 24.501 [23] and TS 24.008 [38]. The first/leftmost bit of the bit string contains the b2 of octet 3 and the second bit of the bit string contains b1 of octet 3 in the value part of the <i>Daylight Saving Time</i> IE in TS 24.008 [38].                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>eventID-TSS</b><br>This field indicates the status of the 5G access stratum time distribution parameter Clock Quality Reporting Control Information as defined in TS 23.501 [32].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>leapSeconds</b><br>Number of leap seconds offset between GPS Time and UTC. UTC and GPS time are related i.e. GPS time -leapSeconds = UTC time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>localTimeOffset</b><br>Offset between UTC and local time in units of 15 minutes. Actual value = field value * 15 minutes. Local time of the day is calculated as UTC time + localTimeOffset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>timeInfoUTC</b><br>Coordinated Universal Time corresponding to the SFN boundary at or immediately after the ending boundary of the SI-window in which SIB9 is transmitted. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the UTC time at the UE. The field counts the number of UTC seconds in 10 ms units since 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900). See NOTE 1. This field is excluded when determining changes in system information, i.e. changes of <i>timeInfoUTC</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> . |

NOTE 1: The UE may use this field together with the *leapSeconds* field to obtain GPS time as follows: GPS Time (in seconds) = timeInfoUTC (in seconds) - 2,524,953,600 (seconds) + leapSeconds, where 2,524,953,600 is the number of seconds between 00:00:00 on Gregorian calendar date 1 January, 1900 and 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time).

— SIB10

SIB10 contains the HRNNs of the NPNs listed in SIB1.

| <b>segmentContainer</b><br>This field includes a segment of the encoded <i>SIB12-IEs</i> . The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when SIB12 is broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>segmentNumber</b><br>This field identifies the sequence number of a segment of <i>SIB12-IEs</i> . A segment number of zero corresponds to the first segment, A segment number of one corresponds to the second segment, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>segmentType</b><br>This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>sl-CSI-Acquisition</b><br>This field indicates whether CSI reporting is enabled in sidelink unicast. If not set, SL CSI reporting is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>sl-DRX-ConfigCommonGC-BC</b><br>This field indicates the sidelink DRX configuration for groupcast and broadcast communication, as specified in TS 38.321 [3]. This field, if present, also indicates the gNB is capable of sidelink DRX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sl-EUTRA-AnchorCarrierFreqList</b><br>This field indicates the EUTRA anchor carrier frequency list, which can provide the NR sidelink communication configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sl-FreqInfoList, sl-FreqInfoListSizeExt, sl-FreqInfoListExt</b><br>This field indicates the NR sidelink communication/discovery configuration on some carrier frequency (ies). In this release, only one entry can be configured in <i>sl-FreqInfoList</i> . More entries can be configured in <i>sl-FreqInfoListSizeExt</i> . If network includes <i>sl-FreqInfoListExt</i> , it includes the same number of entries, and listed in the same order, as in <i>sl-FreqInfoList</i> together with <i>sl-FreqInfoListSizeExt</i> . The first entry corresponds to the AdditionalSpectrumEmission of the frequency of first entry in <i>sl-FreqInfoList</i> broadcast in <i>SIB12</i> , the second entry corresponds to the AdditionalSpectrumEmission of the frequency of first entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> , the third entry corresponds to the AdditionalSpectrumEmission of the frequency of second entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> and so on. |
| <b>sl-L2U2N-Relay</b><br>This field indicates the support of NR sidelink Layer-2 U2N relay operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>sl-NR-AnchorCarrierFreqList</b><br>This field indicates the NR anchor carrier frequency list, which can provide the NR sidelink communication/discovery configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sl-OffsetDFN</b><br>Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference. Value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>sl-RadioBearerConfigList</b><br>This field indicates one or multiple sidelink radio bearer configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| SIB12 field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>segmentContainer</b><br/>This field includes a segment of the encoded <i>SIB12-IEs</i>. The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when SIB12 is broadcast.</p>                                                                                                                                                                                                                                                   |
| <p><b>segmentNumber</b><br/>This field identifies the sequence number of a segment of <i>SIB12-IEs</i>. A segment number of zero corresponds to the first segment, A segment number of one corresponds to the second segment, and so on.</p>                                                                                                                                                                                                                                                                                                          |
| <p><b>segmentType</b><br/>This field indicates whether the included segment is the last segment or not.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>sl-CSI-Acquisition</b><br/>This field indicates whether CSI reporting is enabled in sidelink unicast. If not set, SL CSI reporting is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>sl-RLC-BearerConfigList, sl-RLC-BearerConfigListSizeExt</b><br/>This field indicates one or multiple sidelink RLC bearer configurations. For L2 U2U operation, <i>sl-RLC-BearerConfigList</i> also indicates the PC5 Relay RLC Channel configurations.</p>                                                                                                                                                                                                                                                                                      |
| <p><b>sl-SSB-PriorityNR</b><br/>This field indicates the priority of NR sidelink SSB transmission and reception.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>sl-SyncFreqList</b><br/>Indicates a list of candidate carrier frequencies that can be used for the synchronisation of NR sidelink communication. For <i>SL-Freq-Id-r16</i>, the value 1 corresponds to the frequency of first entry in <i>sl-FreqInfoList</i> broadcast in <i>SIB12</i>, the value 2 corresponds to the frequency of first entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i>, the value 3 corresponds to the frequency of second entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> and so on.</p> |
| <p><b>sl-SyncTxMultiFreq</b><br/>Indicates that the UE transmits S-SSB on multiple carrier frequencies for NR sidelink communication. If this field is absent, the UE transmits S-SSB only on the synchronisation carrier frequency.</p>                                                                                                                                                                                                                                                                                                              |
| <p><b>t400</b><br/>Indicates the value for timer T400 as described in clause 7.1. Value <i>ms100</i> corresponds to 100 ms, value <i>ms200</i> corresponds to 200 ms and so on.</p>                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>t400-U2U</b><br/>Indicates the value for timer T400 to be applied for end-to-end PC5 connection in sidelink U2U relay operation as described in clause 7.1. Value <i>ms200</i> corresponds to 200 ms, value <i>ms400</i> corresponds to 400 ms and so on.</p>                                                                                                                                                                                                                                                                                   |

| SIB15 field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>commonPLMNsWithDisasterCondition</b><br/> A list of PLMN(s) for which disaster condition applies and that disaster inbound roaming is accepted, which can be commonly applicable to the PLMNs sharing the cell.</p> <p><b>applicableDisasterInfoList</b><br/> A list indicating the applicable disaster roaming information for the networks indicated in <i>plmn-IdentityInfoList</i> and <i>npn-IdentityInfoList-r16</i>. The network indicates in this list one entry for each entry of <i>plmn-IdentityInfoList</i>, followed by one entry for each entry of <i>npn-IdentityInfoList-r16</i>, meaning that this list will have as many entries as the number of entries of the combination of <i>plmn-IdentityInfoList</i> and <i>npn-IdentityInfoList-r16</i>. The first entry in this list indicates the disaster roaming information applicable for the network(s) in the first entry of <i>plmn-IdentityInfoList/npn-IdentityInfoList-r16</i>, the second entry in this list indicates the disaster roaming information applicable for the network(s) in the second entry of <i>plmn-IdentityInfoList/npn-IdentityInfoList-r16</i>, and so on. Each entry in this list can either be having the value <i>noDisasterRoaming</i>, <i>disasterRelatedIndication</i>, <i>commonPLMNs</i>, or <i>dedicatedPLMNs</i>. If an entry in this list takes the value <i>noDisasterRoaming</i>, disaster inbound roaming is not allowed in this network(s). If an entry in this list takes the value <i>disasterRelatedIndication</i>, the meaning of this field for this network(s) is as specified for "disaster related indication" in TS 23.122 [74], clause 4.4.3.1.1. If an entry in this list takes the value <i>commonPLMNs</i>, the PLMN(s) with disaster conditions indicated in the field <i>commonPLMNsWithDisasterCondition</i> apply for this network(s). If an entry in this list contains the value <i>dedicatedPLMNs</i>, the listed PLMN(s) are the PLMN(s) with disaster conditions that the network(s) corresponding to this entry accepts disaster inbound roamers from. For SNPNs, the network indicates the value <i>noDisasterRoaming</i>.</p> |

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentContainer</b><br>This field includes a segment of the encoded <i>SIB17</i> -IEs. The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when <i>SIB17</i> is broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>segmentNumber</b><br>This field identifies the sequence number of a segment of <i>SIB17</i> -IEs. A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>segmentType</b><br>This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>trs-ResourceSetConfig</b><br>RS configuration of TRS occasion(s) for idle/inactive UE(s), in terms of a list of N>=1 NZP TRS resource set(s). The maximum number of TRS resource sets configured by higher layer is 64. If a TRS resource is configured, the L1 based availability indication is always enabled based on that configuration. A UE which acquired <i>SIB17</i> with a TRS configuration but did not yet receive an associated L1-based availability indication considers the configured TRS as unavailable. If SIB scheduling indicates that <i>SIB17</i> has changed, the UE considers its configured TRS(s) as unavailable until it receives the associated L1-based availability indication(s). |
| <b>validityDuration</b><br>The valid time duration for L1 availability indication, time unit is one default paging cycle. When the field is absent, UE assumes a default time duration to be 2 default paging cycles. The field is only valid while the UE has a valid <i>SIB17</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                |

| TRS-ResourceSet field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>firstOFDMSymbolInTimeDomain</b><br>The index of the first OFDM symbol in the PRB used for TRS in a slot. The field indicates the first symbol in a slot for the first TRS resource within the slot, and the symbol for the second TRS resource in the same slot can be derived implicitly with symbol index as <i>firstOFDMSymbolInTimeDomain</i> +4.                                                                                                                                                                                                                 |
| <b>frequencyDomainAllocation</b><br>Indicates the offset of the first RE to RE#0 in a RB in row1 in table 7.4.1.5.3-1 for frequency domain allocation within a physical resource block (TS 38.211 [16], clause 7.4.1.5.3).                                                                                                                                                                                                                                                                                                                                               |
| <b>indBitID</b><br>The index of the associated bit in TRS availability indication field in DCI. Each TRS resource set is configured with an ID i for the association with (i+1)-th indication bit in TRS availability indication field in DCI.                                                                                                                                                                                                                                                                                                                           |

#### ***SIB17bis* field descriptions**

##### ***segmentContainer***

This field includes a segment of the encoded *SIB17bis*-IEs. The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when *SIB17bis* is broadcast.

##### ***segmentNumber***

This field identifies the sequence number of a segment of *SIB17bis*-IEs. A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.

##### ***segmentType***

This field indicates whether the included segment is the last segment or not.

##### ***trs-ResourceSetConfig***

RS configuration of TRS occasion(s) for idle/inactive UE(s), in terms of a list of  $N \geq 1$  NZP TRS resource set(s). The maximum number of TRS resource sets configured by higher layer is 64. If a TRS resource is configured, the L1 based availability indication is always enabled based on that configuration. A UE which acquired *SIB17bis* with a TRS configuration but did not yet receive an associated L1-based availability indication considers the configured TRS as unavailable. If SIB scheduling indicates that *SIB17bis* has changed, the UE considers its configured TRS(s) from *SIB17bis* as unavailable until it receives the associated L1-based availability indication(s).

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gin-ElementList</b><br>The <i>gin-ElementList</i> contains one or more GIN elements. Each GIN element contains either one GIN, which is identified by a PLMN ID and a NID, or multiple GINs that share the same PLMN ID. The total number of GINs indicated does not exceed maxGIN-r17. The GIN index <i>m</i> is defined as d1+d2+...+d(n-1)+i for the GIN included in the <i>n</i> -th entry of the <i>gin-ElementList</i> and the <i>i</i> -th entry of its corresponding <i>GIN-Element</i> , where <i>d(k)</i> is the number of GIN index values used in the <i>k</i> -th <i>gin-ElementList</i> entry. |
| <b>gins-PerSNPN-List</b><br>Indicates the supported GINs for each SNPN. The network includes the same number of entries as the number of SNPNS in <i>snpn-AccessInfoList</i> in provided in SIB1, and the <i>n</i> -th entry in this list corresponds to the <i>n</i> -th SNPN listed in <i>snpn-AccessInfoList</i> provided in SIB1. The network configures this field only if the cell broadcasts more than one SNPN in <i>SIB1</i> . If this field is absent, as in case of a single SNPN broadcasted in <i>SIB1</i> , the UE shall associate all GINs in <i>gin-ElementList</i> to that SNPN.               |

| GINS-PerSNPN field descriptions                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>supportedGINS</b><br>Indicates the GINs which are supported by the given SNPN. The first/leftmost bit corresponds to the GIN with GIN index 1, the second bit corresponds to the GIN with GIN index 2 and so on. A bit set to 1 indicates that the GIN is supported by the SNPN. If the field is not present, then the corresponding SNPN does not support any GINs. |

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>distanceThresh</i></b><br/>Distance from the serving cell reference location and is used in location-based measurement initiation in RRC_IDLE and RRC_INACTIVE, as defined in TS 38.304 [20]. Each step represents 50m. This field is only present in an NTN cell.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b><i>movingReferenceLocation</i></b><br/>Reference location of the serving cell of an NTN Earth-moving cell at a time reference. It is used in the evaluation of <i>eventD2</i> and <i>condEventD2</i> criteria for the serving cell in RRC_CONNECTED, and location-based measurement initiation in RRC_IDLE and RRC_INACTIVE when <i>distanceThresh</i> is also configured, as defined in TS 38.304 [20]. The time reference of this field is indicated by <i>epochTime</i> in <i>ntn-Config</i> of the serving cell. This field is excluded when determining changes in system information, i.e., changes to <i>movingReferenceLocation</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>. This field is only present in an NTN cell.</p> |
| <p><b><i>ntn-Config</i></b><br/>Provides parameters needed for the UE to access NR via NTN access such as Ephemeris data, common TA parameters, <i>k_offset</i>, validity duration for UL sync information and epoch time. In a TN cell, this field is only present in <i>ntn-NeighCellConfigList</i> and <i>ntn-NeighCellConfigListExt</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b><i>ntn-NeighCellConfigList</i>, <i>ntn-NeighCellConfigListExt</i></b><br/>Provides a list of NTN neighbour cells including their <i>ntn-Config</i>, carrier frequency and <i>PhysCellId</i>. This set includes all elements of <i>ntn-NeighCellConfigList</i> and all elements of <i>ntn-NeighCellConfigListExt</i>. If <i>ntn-Config</i> is absent for an entry in <i>ntn-NeighCellConfigListExt</i>, the <i>ntn-Config</i> provided in the entry at the same position in <i>ntn-NeighCellConfigList</i> applies. Network provides <i>ntn-Config</i> for the first entry of <i>ntn-NeighCellConfigList</i>. If the <i>ntn-Config</i> is absent for any other entry in <i>ntn-NeighCellConfigList</i>, the <i>ntn-Config</i> provided in the previous entry in <i>ntn-NeighCellConfigList</i> applies.</p>           |
| <p><b><i>referenceLocation</i></b><br/>Reference location of the serving cell provided via NTN (quasi-)Earth fixed cell and is used in location-based measurement initiation in RRC_IDLE and RRC_INACTIVE, as defined in TS 38.304 [20]. This field is only present in an NTN cell.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>satSwitchWithReSync</i></b><br/>Provides parameters for the target satellite required to perform satellite switch with resynchronization. This field is only present in an NTN cell and its presence indicates that satellite switch without PCI change is supported in the cell.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b><i>t-Service</i></b><br/>Indicates the time information on when a cell provided via NTN is going to stop serving the area it is currently covering. This field applies for both service link switches in NTN quasi-Earth fixed cell and feeder link switches for both NTN quasi-Earth fixed and Earth-moving cell. The field indicates a time in multiples of 10 ms after 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900). The exact stop time is between the time indicated by the value of this field minus 1 and the time indicated by the value of this field. The reference point for <i>t-Service</i> is the uplink time synchronization reference point of the cell. This field is only present in an NTN cell.</p>              |

#### NTN-CovEnh field descriptions

##### ***numberOfMsg4HARQ-ACK-Repetitions***

The number of repetition slots for PUCCH transmission with HARQ-ACK information for Msg4, see clause 9.2.6 in TS 38.213 [13]. The first/leftmost bit corresponds to the repetition factor 1, the second bit corresponds to the repetition factor 2, the third bit corresponds to the repetition factor 4, and the last/rightmost bit corresponds to the repetition factor 8. The repetition factor 1 shall be indicated together with at least one other repetition factor.

##### ***rsrp-ThresholdMsg4HARQ-ACK***

This threshold is used by the UE for determining the configuration of the MAC entity for PUCCH repetition for Msg4 HARQ-ACK, as specified in clause 6.2.1 in TS 38.321 [3].

| SatSwitchWithReSync field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <div> <div>ssb-TimeOffset</div> <div>Indicates the time offset of the SSB from target satellite at its uplink time synchronization reference point with respect to the SSB from source satellite at its uplink time synchronization reference point. The starting boundaries of SFN0 of the source satellite and the target satellite are aligned at the uplink time synchronization reference point. The value is given in number of subframes and can only be configured as 5 subframes or multiples of 5 subframes. This field is included only for soft satellite switch with re-synchronization.</div> </div>                                          |
| <div> <div>t-ServiceStart</div> <div>Indicates the time information on when the target satellite is going to start serving the area currently covered by the serving satellite. The field indicates a time in multiples of 10 ms after 00:00:00 on Gregorian calendar date 1<sup>st</sup> January 1900 (midnight between Sunday, December 31, 1899, and Monday, January 1, 1900). The exact start time is between the time indicated by the value of this field minus 1 and the time indicated by the value of this field. The reference point for t-ServiceStart is the uplink time synchronization reference point of the serving satellite.</div> </div> |

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cfr-ConfigMCCH-MTCH</b><br>Common frequency resource used for MCCH and MTCH reception. If the field is absent, the CFR for broadcast has the same location and size as CORESET#0 and PDSCH configuration of MCCH is the same as PDSCH configuration provided in <i>initialDownlinkBWP</i> in <i>SIB1</i> .                                                                                                                                                                                                                                          |
| <b>cfr-ConfigMCCH-MTCH-RedCap</b><br>Common frequency resource used for MCCH and MTCH reception for (e)RedCap UEs. If the field is absent, the (e)RedCap UE can use <i>cfr-ConfigMCCH-MTCH</i> if the UE supports the configured bandwidth.                                                                                                                                                                                                                                                                                                            |
| <b>mcch-ConfigRedcap</b><br>Indicates MBS broadcast MCCH configuration for (e)Redcap UEs. If the field is absent, the (e)RedCap UE can use <i>mcch-Config</i> if the UE supports the bandwidth configured by <i>cfr-ConfigMCCH-MTCH</i> .                                                                                                                                                                                                                                                                                                              |
| <b>mcch-ModificationPeriod</b><br>Defines periodically appearing boundaries, i.e. radio frames for which $\text{SFN mod } mcch\text{-ModificationPeriod} = 0$ . The contents of different transmissions of MCCH information can only be different if there is at least one such boundary in-between them. Value rf2 corresponds to two radio frames, value rf4 corresponds to four radio frames and so on.                                                                                                                                             |
| <b>mcch-RepetitionPeriodAndOffset</b><br>Defines the length and the offset of the MCCH repetition period. rf1 corresponds to a repetition period length of one radio frame, rf2 corresponds to a repetition period length of two radio frames and so on. The corresponding integer value indicates the offset of the repetition period in the number of radio frames. MCCH is scheduled in the MCCH transmission window starting from each radio frame for which: $\text{SFN mod repetition period length} = \text{offset of the repetition period}$ . |
| <b>mcch-WindowDuration</b><br>Indicates, starting from the slot indicated by <i>mcch-WindowStartSlot</i> , the duration in slots during which MCCH may be scheduled. Absence of this field means that MCCH is only scheduled in the slot indicated by <i>mcch-WindowStartSlot</i> . The network always configures <i>mcch-WindowDuration</i> to be shorter or equal to the length of MCCH repetition period.                                                                                                                                           |
| <b>mcch-WindowStartSlot</b><br>Indicates the slot in which MCCH transmission window starts.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>areaScope</b><br>Indicates that a posSIB is area specific. If the field is absent, the posSIB is cell specific.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>encrypted</b><br>The presence of this field indicates that the <i>pos-sib-type</i> is encrypted as specified in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                                            |
| <b>gnss-id</b><br>The presence of this field indicates that the positioning SIB type is for a specific GNSS. Indicates a specific GNSS (see also TS 37.355 [49])                                                                                                                                                                                                                                                                                                                                              |
| <b>posSchedulingInfoList</b><br>List of scheduling information for SI messages. If <i>si-SchedulingInfo-v1700</i> is present, the network ensures that the total number of SI messages in the concatenated list of SI messages configured by <i>posSchedulingInfoList</i> in <i>posSI-SchedulingInfo</i> and SI messages containing type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> does not exceed the limit of <i>maxSI-Message</i> .                                  |
| <b>posSI-BroadcastStatus</b><br>Indicates if the SI message is being broadcasted or not. Change of <i>posSI-BroadcastStatus</i> should not result in system information change notifications in Short Message transmitted with P-RNTI over DCI (see clause 6.5). The value of the indication is valid until the end of the BCCH modification period when set to <i>broadcasting</i> .                                                                                                                         |
| <b>posSI-RequestConfig</b><br>Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> .                                                                                                                                                                                    |
| <b>posSI-RequestConfigMSG1-Repetition</b><br>Configuration of Msg1 repetition resources on NUL that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                              |
| <b>posSI-RequestConfigRedCap</b><br>Configuration of Msg1 resources for <i>initialUplinkBWP-RedCap</i> that the (e)RedCap UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> .                                                                                                                                 |
| <b>posSI-RequestConfigRedCap-MSG1-Repetition</b><br>Configuration of Msg1 repetition resources for <i>initialUplinkBWP-RedCap</i> that the (e)RedCap UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages. |
| <b>posSI-RequestConfigSUL</b><br>Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> .                                                                                                                                                                                 |
| <b>posSI-RequestConfigSUL-MSG1-Repetition</b><br>Configuration of Msg1 repetition resources on SUL that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                          |
| <b>posSIB-MappingInfo</b><br>List of the posSIBs mapped to this <i>SystemInformation</i> message.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>posSibType</b><br>The positioning SIB type is defined in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>posSI-Periodicity</b><br>Periodicity of the SI-message in radio frames, such that rf8 denotes 8 radio frames, rf16 denotes 16 radio frames, and so on. If the <i>offsetToSI-Used</i> is configured, the <i>posSI-Periodicity</i> of rf8 cannot be used.                                                                                                                                                                                                                                                    |
| <b>offsetToSI-Used</b><br>This field, if present, indicates that all the SI messages in <i>posSchedulingInfoList</i> are scheduled with an offset of 8 radio frames compared to SI messages in <i>schedulingInfoList</i> . <i>offsetToSI-Used</i> may be present only if the shortest configured SI message periodicity for SI messages in <i>schedulingInfoList</i> is 80ms. If SI offset is used, this field is present in each of the SI messages in the <i>posSchedulingInfoList</i> .                    |

|                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sbas-id</i></b><br>The presence of this field indicates that the positioning SIB type is for a specific SBAS. Indicates a specific SBAS (see also TS 37.355 [49]). |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>GNSS-ID-SBAS</i>  | The field is mandatory present if <i>gnss-id</i> is set to <i>sbas</i> . It is absent otherwise.                                                                                                                                                                                                                                                                                                                                       |
| <i>MSG-1</i>         | The field is optionally present, Need R, if <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>posSchedulingInfoList</i> or if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message containing type2 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.                                                                                        |
| <i>SUL-MSG-1</i>     | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfigCommonSIB</i> , and if <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>posSchedulingInfoList</i> or if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message containing type2 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise. |
| <i>REDCAP-MSG-1</i>  | The field is optionally present, Need R, if <i>initialUplinkBWP-RedCap</i> is configured in <i>UplinkConfigCommonSIB</i> , and if <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>posSchedulingInfoList</i> or if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message containing type2 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.  |

– *SIBpos*

The IE *SIBpos* contains positioning assistance data as defined in TS 37.355 [49].

*SIBpos* information element

```
-- ASN1START
-- TAG-SIPOS-START

SIBpos-r16 ::= SEQUENCE {
    assistanceDataSIB-Element-r16      OCTET STRING,
    lateNonCriticalExtension             OCTET STRING OPTIONAL,
    ...
}

-- TAG-SIPOS-STOP
-- ASN1STOP
```

| <i>SIBpos</i> field descriptions                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>assistanceDataSIB-Element</i></b><br>Parameter <i>AssistanceDataSIBelement</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. |

6.3.2 Radio resource control information elements

– *AdditionalPCIIndex*

The IE *AdditionalPCIIndex* identifies an additional physical cell identity (PCI) configured with *additionalPCI-ToAddModList-r17* in *ServingCellConfig*.

***AdditionalPCIIndex* information element**

```
-- ASN1START
-- TAG-ADDITIONALPCIINDEX-START

AdditionalPCIIndex-r17 ::= INTEGER(1..maxNrofAdditionalPCI-r17)

-- TAG-ADDITIONALPCIINDEX-STOP
-- ASN1STOP
```

***AdditionalSpectrumEmission***

The IE *AdditionalSpectrumEmission* is used to indicate emission requirements to be fulfilled by the UE (see TS 38.101-1 [15], clause 6.2.3/6.2A.3, TS 38.101-2 [39], clause 6.2.3/6.2A.3, and TS 38.101-5 [75], clause 6.2.3). If an extension is signalled using the extended value range (as defined by the IE *AdditionalSpectrumEmission-v1760*), the corresponding original field, using the value range as defined by the IE *AdditionalSpectrumEmission* (without suffix) shall be set to value 7.

***AdditionalSpectrumEmission* information element**

```
-- ASN1START
-- TAG-ADDITIONALSPECTRUMEMISSION-START

AdditionalSpectrumEmission ::= INTEGER (0..7)

AdditionalSpectrumEmission-v1760 ::= INTEGER (8..39)

AdditionalSpectrumEmission-r18 ::= INTEGER (0..39)

-- TAG-ADDITIONALSPECTRUMEMISSION-STOP
-- ASN1STOP
```

***AdvancedReceiver-MU-MIMO***

The IE *AdvancedReceiver-MU-MIMO* is used to provide a set of assistance information for R-ML (reduced complexity ML) receivers with enhanced inter-user interference suppression for MU-MIMO transmissions.

***AdvancedReceiver-MU-MIMO* information element**

```
-- ASN1START
-- TAG-ADVANCEDRECEIVER-MU-MIMO-START

AdvancedReceiver-MU-MIMO-r18 ::= SEQUENCE {
    precodingAndResourceAllocation-r18    BOOLEAN                OPTIONAL, -- Need M

| <b><i>flightPathUpdateDistanceThr</i></b><br>Distance threshold for triggering flight path update indication. Actual value is 5 x field value in meters. |
| <b><i>flightPathUpdateTimeThr</i></b><br>Time threshold for triggering flight path update indication. Value in seconds.                                  |

— *Alpha*

The IE *Alpha* defines possible values of a the pathloss compensation coefficient for uplink power control. Value *alpha0* corresponds to the value 0, Value *alpha04* corresponds to the value 0.4, Value *alpha05* corresponds to the value 0.5 and so on. Value *alpha1* corresponds to value 1. See also clause 7.1 of TS 38.213 [13].

```
-- ASN1START
-- TAG-ALPHA-START

Alpha ::=
    ENUMERATED {alpha0, alpha04, alpha05, alpha06, alpha07, alpha08, alpha09, alpha1}

-- TAG-ALPHA-STOP
-- ASN1STOP
```

— *Altitude*

The IE *Altitude* is used to indicate altitude relative to sea level. The actual value is the field value in meters.

***Altitude* information element**

```
-- ASN1START
-- TAG-ALTITUDE-START

Altitude-r18 ::=
    INTEGER (minAltitude-r18..maxAltitude-r18)

-- TAG-ALTITUDE-STOP
-- ASN1STOP
```

— *AMF-Identifier*

The IE *AMF-Identifier* (AMFI) comprises of an AMF Region ID, an AMF Set ID and an AMF Pointer as specified in TS 23.003 [21], clause 2.10.1.

***AMF-Identifier* information element**

```
-- ASN1START
-- TAG-AMF-IDENTIFIER-START
```

```

AMF-Identifier ::= BIT STRING (SIZE (24))

-- TAG-AMF-IDENTIFIER-STOP
-- ASN1STOP

```

### — *ARFCN-ValueEUTRA*

The IE *ARFCN-ValueEUTRA* is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) E-UTRA carrier frequency, as defined in TS 36.101 [22].

#### ***ARFCN-ValueEUTRA* information element**

```

-- ASN1START
-- TAG-ARFCN-VALUEEUTRA-START

ARFCN-ValueEUTRA ::= INTEGER (0..maxEARFCN)

-- TAG-ARFCN-VALUEEUTRA-STOP
-- ASN1STOP

```

### — *ARFCN-ValueNR*

The IE *ARFCN-ValueNR* is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) NR global frequency raster, as defined in TS 38.101-1 [15], TS 38.101-2 [39] and TS 38.101-5 [75], clause 5.4.2.

```

-- ASN1START
-- TAG-ARFCN-VALUENR-START

ARFCN-ValueNR ::= INTEGER (0..maxNARFCN)

-- TAG-ARFCN-VALUENR-STOP
-- ASN1STOP

```

### — *ARFCN-ValueUTRA-FDD*

The IE *ARFCN-ValueUTRA-FDD* is used to indicate the ARFCN applicable for a downlink (Nd, FDD) UTRA-FDD carrier frequency, as defined in TS 25.331 [45].

#### ***ARFCN-ValueUTRA-FDD* information element**

```

-- ASN1START
-- TAG-ARFCN-ValueUTRA-FDD-START

ARFCN-ValueUTRA-FDD-r16 ::= INTEGER (0..16383)

```

-- TAG-ARFCN-ValueUTRA-FDD-STOP  
-- ASN1STOP

— *ATG-Config*

The IE *ATG-Config* provides parameters needed for the UE to access NR via ATG access.

**ATG-Config information element**

```
-- ASN1START
-- TAG-ATG-CONFIG-START

ATG-Config-r18 ::= SEQUENCE {
    atg-gNB-Location-r18      ReferenceLocation-r17      OPTIONAL, -- Need R

| <b>resourceAvailability</b>                       | Indicates the resource availability of soft symbols for a set of consecutive slots in the time domain. The meaning of this field is described in TS 38.213 [13], Table 14.3. If included in <i>RB-SetGroup</i> within <i>AvailabilityCombinationRB-Groups-r17</i> , it indicates the availability of soft resources for an RB set group. If included in <i>AvailabilityCombinationRB-Groups-r17</i> when the <i>rb-SetGroups</i> is not configured, it indicates the availability of soft resources in one or multiple slots for all RB sets of a DU cell. |

| <b><i>beamFailureRecoveryTimer</i></b><br>Timer for beam failure recovery timer. Upon expiration of the timer the UE does not use CFRA for BFR. Value in ms. Value <i>ms10</i> corresponds to 10 ms, value <i>ms20</i> corresponds to 20 ms, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>candidateBeamRSList</i>, <i>candidateBeamRSListExt-v1610</i></b><br>Set of reference signals (CSI-RS and/or SSB) identifying the candidate beams for recovery and the associated RA parameters. This set includes all elements of <i>candidateBeamRSList</i> (without suffix) and all elements of <i>candidateBeamRSListExt-v1610</i> . The UE maintains <i>candidateBeamRSList</i> and <i>candidateBeamRSListExt-v1610</i> separately: Receiving <i>candidateBeamRSListExt-v1610</i> set to <i>release</i> releases only the entries that were configured by <i>candidateBeamRSListExt-v1610</i> , and receiving <i>candidateBeamRSListExt-v1610</i> set to <i>setup</i> replaces only the entries that were configured by <i>candidateBeamRSListExt-v1610</i> with the newly signalled entries. The network configures these reference signals to be within the linked DL BWP (i.e., within the DL BWP with the same <i>bwp-Id</i> ) of the UL BWP in which the <i>BeamFailureRecoveryConfig</i> is provided. |
| <b><i>msg1-SubcarrierSpacing</i></b><br>Subcarrier spacing for contention free beam failure recovery (see TS 38.211 [16], clause 5.3.2).<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>rsrp-ThresholdSSB</i></b><br>L1-RSRP threshold used for determining whether a candidate beam may be used by the UE to attempt contention free random access to recover from beam failure (see TS 38.213 [13], clause 6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>ra-prioritization</i></b><br>Parameters which apply for prioritized random access procedure for BFR (see TS 38.321 [3], clause 5.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>ra-PrioritizationTwoStep</i></b><br>Parameters which apply for prioritized 2-step random access procedure for BFR (see TS 38.321 [3], clause 5.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>ra-ssb-OccasionMaskIndex</i></b><br>Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>rach-ConfigBFR</i></b><br>Configuration of random access parameters for BFR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>recoverySearchSpaceId</i></b><br>Search space to use for BFR RAR. The network configures this search space to be within the linked DL BWP (i.e., within the DL BWP with the same <i>bwp-Id</i> ) of the UL BWP in which the <i>BeamFailureRecoveryConfig</i> is provided. The CORESET associated with the recovery search space cannot be associated with another search space. Network always configures the UE with a value for this field when contention free random access resources for BFR are configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>rootSequenceIndex-BFR</i></b><br>PRACH root sequence index (see TS 38.211 [16], clause 6.3.3.1) for beam failure recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>ra-PreambleIndex</b><br>The preamble index that the UE shall use when performing BFR upon selecting the candidate beams identified by this SSB. |
| <b>ssb</b><br>The ID of an SSB transmitted by this serving cell. It determines a candidate beam for beam failure recovery (BFR).                   |

## – *BeamFailureRecoveryRSConfig*

The IE *BeamFailureRecoveryRSConfig* is used to configure the UE with candidate beams for beam failure recovery in case of beam failure detection. See also TS 38.321 [3], clause 5.17.

### *BeamFailureRecoveryRSConfig* information element

```
-- ASN1START
-- TAG-BEAMFAILURERECOVERYRSCONFIG-START

BeamFailureRecoveryRSConfig-r16 ::= SEQUENCE {
    rsrp-ThresholdBFR-r16          RSRP-Range                                OPTIONAL, -- Need M
    candidateBeamRS-List-r16       SEQUENCE (SIZE(1..maxNrofCandidateBeams-r16)) OF CandidateBeamRS-r16  OPTIONAL, -- Need M
    ...,
    [[
        candidateBeamRS-List2-r17  SEQUENCE (SIZE(1..maxNrofCandidateBeams-r16)) OF CandidateBeamRS-r16  OPTIONAL -- Need R
    ]]
}

-- TAG-BEAMFAILURERECOVERYRSCONFIG-STOP
-- ASN1STOP
```

| <i>BeamFailureRecoveryRSConfig</i> field descriptions                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>candidateBeamRS-List</i></b><br>A list of reference signals (CSI-RS and/or SSB) identifying the candidate beams for recovery. The network always configures this parameter in every instance of this IE.                                                              |
| <b><i>candidateBeamRS-List2</i></b><br>A list of reference signals (CSI-RS and/or SSB) identifying the candidate beams for recovery.                                                                                                                                        |
| <b><i>rsrp-ThresholdBFR</i></b><br>L1-RSRP threshold used for determining whether a candidate beam may be included by the UE in MAC CE for BFR (see TS 38.321 [3] and TS 38.213 [13], clause 6). The network always configures this parameter in every instance of this IE. |

– *BetaOffsets*

The IE *BetaOffsets* is used to configure beta-offset values, see TS 38.213 [13], clause 9.3.

*BetaOffsets* information element

```
-- ASN1START
-- TAG-BETAOFFSETS-START

BetaOffsets ::=
    betaOffsetACK-Index1      INTEGER(0..31)
    betaOffsetACK-Index2      INTEGER(0..31)
    betaOffsetACK-Index3      INTEGER(0..31)
    betaOffsetCSI-Part1-Index1 INTEGER(0..31)
    betaOffsetCSI-Part1-Index2 INTEGER(0..31)
    betaOffsetCSI-Part2-Index1 INTEGER(0..31)
    betaOffsetCSI-Part2-Index2 INTEGER(0..31)
}

-- TAG-BETAOFFSETS-STOP

| <i>BetaOffsets</i> field descriptions                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>betaOffsetACK-Index1</i></b><br>Up to 2 bits HARQ-ACK (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 11.                  |
| <b><i>betaOffsetACK-Index2</i></b><br>Up to 11 bits HARQ-ACK (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 11.                 |
| <b><i>betaOffsetACK-Index3</i></b><br>Above 11 bits HARQ-ACK (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 11.                 |
| <b><i>betaOffsetCSI-Part1-Index1</i></b><br>Up to 11 bits of CSI part 1 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |
| <b><i>betaOffsetCSI-Part1-Index2</i></b><br>Above 11 bits of CSI part 1 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |
| <b><i>betaOffsetCSI-Part2-Index1</i></b><br>Up to 11 bits of CSI part 2 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |
| <b><i>betaOffsetCSI-Part2-Index2</i></b><br>Above 11 bits of CSI part 2 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |

## — *BetaOffsetsCrossPri*

The IE *BetaOffsetsCrossPri* is used to configure beta-offset values for cross-priority HARQ-ACK multiplexing on PUSCH.

### *BetaOffsetsCrossPri* information element

```
-- ASN1START
-- TAG-BETAOFFSETSCROSSPRI-START

BetaOffsetsCrossPri-r17 ::= SEQUENCE (SIZE(3)) OF INTEGER(0..31)

-- TAG-BETAOFFSETSCROSSPRI-STOP
-- ASN1STOP
```

## — *BH-LogicalChannelIdentity*

The IE *BH-LogicalChannelIdentity* is used to identify a logical channel between an IAB-node and its parent IAB-node or IAB-donor-DU.

### *BH-LogicalChannelIdentity* information element

```
-- ASN1START
-- TAG-BHLOGICALCHANNELIDENTITY-START

BH-LogicalChannelIdentity-r16 ::= CHOICE {
    bh-LogicalChannelIdentity-r16      LogicalChannelIdentity,
    bh-LogicalChannelIdentityExt-r16   BH-LogicalChannelIdentity-Ext-r16
}

-- TAG-BHLOGICALCHANNELIDENTITY-STOP
```

-- ASN1STOP

| BH-LogicalChannelIdentity field descriptions |                                      |
|----------------------------------------------|--------------------------------------|
| <b>bh-LogicalChannelIdentity</b>             | ID used for the MAC logical channel. |
| <b>bh-LogicalChannelIdentityExt</b>          | ID used for the MAC logical channel. |

— *BH-LogicalChannelIdentity-Ext*

The IE *BH-LogicalChannelIdentity-Ext* is used to identify a logical channel between an IAB-node and its parent node.

*BH-LogicalChannelIdentity-Ext* information element

```
-- ASN1START
-- TAG-BHLOGICALCHANNELIDENTITYEXT-START

BH-LogicalChannelIdentity-Ext-r16 ::=  INTEGER (320.. maxLC-ID-Iab-r16)

-- TAG-BHLOGICALCHANNELIDENTITYEXT-STOP
-- ASN1STOP
```

— *BH-RLC-ChannelConfig*

The IE *BH-RLC-ChannelConfig* is used to configure an RLC entity, a corresponding logical channel in MAC for BH RLC channel between IAB-node and its parent node.

*BH-RLC-ChannelConfig* information element

```
-- ASN1START
-- TAG-BHRLCCHANNELCONFIG-START

BH-RLC-ChannelConfig-r16 ::=  SEQUENCE {
    bh-LogicalChannelIdentity-r16  BH-LogicalChannelIdentity-r16  OPTIONAL,  -- Cond LCH-SetupOnly

— *BWP*

The IE *BWP* is used to configure generic parameters of a bandwidth part as defined in TS 38.211 [16], clause 4.5, and TS 38.213 [13], clause 12.

For each serving cell the network configures at least an initial downlink bandwidth part and one (if the serving cell is configured with an uplink) or two (if using supplementary uplink (SUL)) initial uplink bandwidth parts. Furthermore, the network may configure additional uplink and downlink bandwidth parts for a serving cell.

The uplink and downlink bandwidth part configurations are divided into common and dedicated parameters.

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>cyclicPrefix</b></p> <p>Indicates whether to use the extended cyclic prefix for this bandwidth part. If not set, the UE uses the normal cyclic prefix. Normal CP is supported for all subcarrier spacings and slot formats. Extended CP is supported only for 60 kHz subcarrier spacing. (see TS 38.211 [16], clause 4.2). Except for SUL, the network ensures the same cyclic prefix length is used in active DL BWP and active UL BWP within a serving cell. If RedCap-specific initial DL BWP is configured, the network ensures the same cyclic prefix length is configured for initial DL BWP and RedCap-specific initial DL BWP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>locationAndBandwidth</b></p> <p>Frequency domain location and bandwidth of this bandwidth part. The value of the field shall be interpreted as resource indicator value (RIV) as defined TS 38.214 [19] with assumptions as described in TS 38.213 [13], clause 12, i.e. setting <math>N_{\text{BWP}}^{\text{size}}=275</math>. The first PRB is a PRB determined by <i>subcarrierSpacing</i> of this BWP and <i>offsetToCarrier</i> (configured in <i>SCS-SpecificCarrier</i> contained within <i>FrequencyInfoDL</i> / <i>FrequencyInfoUL</i> / <i>FrequencyInfoUL-SIB</i> / <i>FrequencyInfoDL-SIB</i> within <i>ServingCellConfigCommon</i> / <i>ServingCellConfigCommonSIB</i>) corresponding to this subcarrier spacing. In case of TDD, a BWP-pair (UL BWP and DL BWP with the same <i>bwp-Id</i>) must have the same center frequency (see TS 38.213 [13], clause 12)</p>                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>subcarrierSpacing</b></p> <p>Subcarrier spacing to be used in this BWP for all channels and reference signals unless explicitly configured elsewhere. Corresponds to subcarrier spacing according to TS 38.211 [16], table 4.2-1. The value <i>kHz15</i> corresponds to <math>\mu=0</math>, value <i>kHz30</i> corresponds to <math>\mu=1</math>, and so on.</p> <p>Only the following values are applicable depending on the used frequency:</p> <p>FR1: 15, 30, or 60 kHz</p> <p>FR2-1/FR2-NTN: 60 or 120 kHz</p> <p>FR2-2: 120, 480, or 960 kHz</p> <p>For the initial DL BWP and operation in licensed spectrum this field has the same value as the field <i>subCarrierSpacingCommon</i> in <i>MIB</i> of the same serving cell. Except for SUL, the network ensures the same subcarrier spacing is used in active DL BWP and active UL BWP within a serving cell. For the initial DL BWP and operation with shared spectrum channel access, the value of this field corresponds to the subcarrier spacing of the SSB associated to the initial DL BWP. If RedCap-specific initial DL BWP is configured, the network ensures the same subcarrier spacing is configured for initial DL BWP and RedCap-specific initial DL BWP.</p> |

— **BWP-Downlink**

The IE *BWP-Downlink* is used to configure an additional downlink bandwidth part (not for the initial BWP).

**BWP-Downlink information element**

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b><i>bwp-Id</i></b><br>An identifier for this bandwidth part. Other parts of the RRC configuration use the <i>BWP-Id</i> to associate themselves with a particular bandwidth part. The network configures the BWPs with consecutive IDs from 1. The Network does not include the value 0, since value 0 is reserved for the initial BWP. |  |

| Conditional Presence | Explanation                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>SetupOtherBWP</i> | The field is mandatory present upon configuration of a new DL BWP. The field is optionally present, Need M, otherwise. |

– *BWP-DownlinkCommon*

The IE *BWP-DownlinkCommon* is used to configure the common parameters of a downlink BWP. They are "cell specific" and the network ensures the necessary alignment with corresponding parameters of other UEs. The common parameters of the initial bandwidth part of the PCell are also provided via system information. For all other serving cells, the network provides the common parameters via dedicated signalling.

***BWP-DownlinkCommon* information element**

```
-- ASN1START
-- TAG-BWP-DOWNLINKCOMMON-START

BWP-DownlinkCommon ::=
    genericParameters
    pdcch-ConfigCommon
    pdsch-ConfigCommon

| <b><i>beamFailureRecoverySCellConfig</i></b><br>Configuration of candidate RS for beam failure recovery on SCells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>beamFailureRecoverySpCellConfig</i></b><br>Configuration of candidate RS for beam failure recovery on the SpCell. This field can only be configured when <i>beamFailure-r17</i> is configured in <i>RadioLinkMonitoringConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>cfr-ConfigMulticast</i></b><br>UE specific common frequency resource configuration for MBS multicast for one dedicated BWP. This field can be configured within at most one serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>dl-PPW-PreConfigToAddModList</i></b><br>Indicates a list of DL-PRS processing window configurations to be added or modified for the dedicated DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>dl-PPW-PreConfigToReleaseList</i></b><br>Indicates a list of DL-PRS processing window configurations to be released for the dedicated DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>harq-FeedbackEnablingforSPSActive</i></b><br>If enabled, UE reports ACK/NACK for the first SPS PDSCH after activation, regardless of if HARQ feedback is enabled or disabled for the HARQ process corresponding to the first SPS PDSCH after activation. Otherwise, UE follows configuration of HARQ feedback enabled/disabled for the HARQ process corresponding to the first SPS PDSCH after activation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>nonCellDefiningSSB</i></b><br>If configured, the UE operating in this BWP uses this SSB for the purposes for which it would otherwise have used the CD-SSB of the serving cell (e.g. obtaining sync, measurements, RLM, BFD, beam management). Furthermore, other parts of the BWP configuration that refer to an SSB (e.g. the "SSB" configured in the <i>QCL-Info</i> IE; the "ssb-Index" configured in the <i>RadioLinkMonitoringRS</i> ; <i>CFRA-SSB-Resource</i> ; <i>PRACH-ResourceDedicatedBFR</i> ) refer implicitly to this NCD-SSB. The NCD-SSB has the same values for the properties (e.g., <i>ssb-PositionsInBurst</i> , <i>PCI</i> , <i>ssb-PBCH-BlockPower</i> ) of the corresponding CD-SSB apart from the values of the properties configured in the <i>NonCellDefiningSSB-r17</i> IE. In the MIB associated with this NCD-SSB, the <i>systemFrameNumber</i> field indicates the frame boundary and frame number of the NCD-SSB. The <i>subCarrierSpacingCommon</i> and <i>dmrs-TypeA-Position</i> field in the MIBs associated with CD-SSB and NCD-SSB in the same cell are configured with the same values, respectively. |
| <b><i>pdcch-Config</i></b><br>UE specific PDCCH configuration for one BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>pdsch-Config</i></b><br>UE specific PDSCH configuration for one BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>preConfigGapStatus</i></b><br>Indicates whether the pre-configured measurement gaps (i.e. the gaps configured with <i>preConfigInd</i> ) are activated or deactivated upon the switch to this BWP. If this field is configured, the UE shall apply network-controlled mechanism for activation and deactivation of the pre-configured measurement gaps, otherwise the UE shall apply the autonomous activation/deactivation mechanism, as specified in TS 38.133 [14]. The first/leftmost bit corresponds to the measurement gap with gap ID 1, the second bit corresponds to measurement gap with gap ID 2, and so on. Value 0 indicates that the corresponding pre-configured measurement gap is deactivated while value 1 indicates that the corresponding pre-configured measurement gap is activated. The UE shall ignore the bit if the corresponding measurement gap is not a pre-configured measurement gap.                                                                                                                                                                                                                         |
| <b><i>servingCellMO</i></b><br><i>measObjectID</i> of the <i>MeasObjectNR</i> in <i>MeasConfig</i> which is associated to the serving cell. For this <i>MeasObjectNR</i> , the following relationship applies between this <i>MeasObjectNR</i> and <i>nonCellDefiningSSB</i> in <i>BWP-DownlinkDedicated</i> of the associated downlink BWP: if <i>ssbFrequency</i> is configured, its value is the same as the <i>absoluteFrequencySSB</i> in the <i>nonCellDefiningSSB</i> . If the field is present in a downlink BWP and the BWP is activated, the UE uses this measurement object for serving cell measurements (e.g., including those used in measurement report triggering events), otherwise, the UE uses the <i>servingCellMO</i> in <i>ServingCellConfig</i> IE.                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>sps-Config</i></b><br>UE specific SPS (Semi-Persistent Scheduling) configuration for one BWP. Except for reconfiguration with sync, the NW does not reconfigure <i>sps-Config</i> when there is an active configured downlink assignment (see TS 38.321 [3]). However, the NW may release the <i>sps-Config</i> at any time. Network can only configure SPS in one BWP using either this field or <i>sps-ConfigToAddModList</i> . Network does not configure SPS in one BWP using this field and <i>sps-ConfigMulticastToAddModList-r17</i> simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>sps-ConfigDeactivationStateList</i></b><br>Indicates a list of the deactivation states in which each state can be mapped to a single or multiple SPS configurations to be deactivated, see clause 10.2 in TS 38.213 [13]. If a state is mapped to multiple SPS configurations, each of these SPS configurations is configured with the same <i>harq-CodebookID</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sps-ConfigToAddModList</i></b>                                                                                                                                                                                                                                                                                                              |
| Indicates a list of one or more DL SPS configurations to be added or modified in one BWP. Except for reconfiguration with sync, the NW does not reconfigure a SPS configuration when it is active (see TS 38.321 [3]).                                                                                                                            |
| <b><i>sps-ConfigToReleaseList</i></b>                                                                                                                                                                                                                                                                                                             |
| Indicates a list of one or more DL SPS configurations to be released. The NW may release a SPS configuration at any time.                                                                                                                                                                                                                         |
| <b><i>radioLinkMonitoringConfig</i></b>                                                                                                                                                                                                                                                                                                           |
| UE specific configuration of radio link monitoring for detecting cell- and beam radio link failure occasions. The maximum number of failure detection resources should be limited up to 8 for both cell and beam radio link failure detection. For SCells, only periodic 1-port CSI-RS can be configured in IE <i>RadioLinkMonitoringConfig</i> . |
| <b><i>sl-PDCCH-Config</i></b>                                                                                                                                                                                                                                                                                                                     |
| Indicates the UE specific PDCCH configurations for receiving the SL grants (via SL-RNTI or SL-CS-RNTI) for NR sidelink communication/discovery.                                                                                                                                                                                                   |
| <b><i>sl-V2X-PDCCH-Config</i></b>                                                                                                                                                                                                                                                                                                                 |
| Indicates the UE specific PDCCH configurations for receiving SL grants (i.e. sidelink SPS) for V2X sidelink communication.                                                                                                                                                                                                                        |

## — *BWP-Id*

The IE *BWP-Id* is used to refer to Bandwidth Parts (BWP). The initial BWP (including RedCap-specific initial BWP, if configured) is referred to by *BWP-Id* 0. The other BWPs are referred to by *BWP-Id* 1 to *maxNrofBWPs*.

### ***BWP-Id* information element**

```
-- ASN1START

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>bwp-Id</b><br>An identifier for this bandwidth part. Other parts of the RRC configuration use the <i>BWP-Id</i> to associate themselves with a particular bandwidth part. The network configures the BWPs with consecutive IDs from 1. The Network does not include the value 0, since value 0 is reserved for the initial BWP. |  |

| Conditional Presence | Explanation                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| SetupOtherBWP        | The field is mandatory present upon configuration of a new UL BWP. The field is optionally present, Need M, otherwise. |

— *BWP-UplinkCommon*

The IE *BWP-UplinkCommon* is used to configure the common parameters of an uplink BWP. They are "cell specific" and the network ensures the necessary alignment with corresponding parameters of other UEs. The common parameters of the initial bandwidth part of the PCell, excluding *additionalRACH-perPCI-ToAddModList* and *additionalRACH-perPCI-ToReleaseList*, are also provided via system information. For all other serving cells, the network provides the common parameters via dedicated signalling.

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>additionalRACH-ConfigList</i></b><br/>List of feature or feature combination-specific RACH configurations, i.e. the RACH configurations configured in addition to the one configured by <i>rach-ConfigCommon</i> and by <i>msgA-ConfigCommon</i>. The network associates all possible preambles of an additional RACH configuration to one or more feature(s) or feature combination(s). The network does not configure this list to have more than 16 entries. If both <i>rach-ConfigCommon</i> and <i>msgA-ConfigCommon</i> are configured for a specific <i>FeatureCombination</i>, the network always provides them in the same <i>additionalRACH-Config</i>.</p>                                                                                                                                                                                                                                                                                                                 |
| <p><b><i>additionalRACH-perPCI-ToAddModList</i>, <i>additionalRACH-perPCI-ToReleaseList</i></b><br/>List of RACH configurations for the additional PCIs. The RACH configuration for an additional PCI is applied for Random Access procedure initiated by PDCCH order towards to the additional PCI, as specified in TS 38.321 clause 5.1.1b. This list includes the same number of elements like <i>additionalPCI-ToAddModList</i> for this serving cell and the <i>n</i>-th element of this list is for the PCI in the <i>n</i>-th element of <i>additionalPCI-ToAddModList</i>. Either the network does not configure any RACH configuration for any additional PCI, or the network configures a RACH configuration for each additional PCI. When the network releases an additional PCI of a serving cell, the network also explicitly releases the associated random access configuration in every UL BWP of the serving cell. This configuration may be different for different UEs.</p> |
| <p><b><i>enableRA-PrioritizationForSlicing</i></b><br/>Indicates whether or not the <i>ra-PrioritizationForSlicing/ra-PrioritizationForSlicingTwoStep</i> should override the <i>ra-PrioritizationForAccessIdentity</i>. The field is applicable only when the UE is configured by upper layers with both NSAG and Access Identity 1 or 2. If value <i>TRUE</i> is configured, the UE should only apply the <i>ra-PrioritizationForSlicing/ra-PrioritizationForSlicingTwoStep</i>. If value <i>FALSE</i> is configured, the UE should only apply <i>ra-PrioritizationForAccessIdentity</i>. If the field is absent, whether to use <i>ra-PrioritizationForSlicing/ra-PrioritizationForSlicingTwoStep</i> or <i>ra-PrioritizationForAccessIdentity</i> is up to UE implementation.</p>                                                                                                                                                                                                          |
| <p><b><i>mcs-Msg3-Repetitions</i></b><br/>Configuration of eight candidate MCS indexes for PUSCH transmission scheduled by RAR UL grant and DCI format 0_0 with CRC scrambled by TC-RNTI. Only the first 4 configured or default MCS indexes are used for PUSCH transmission scheduled by RAR UL grant. This field is only applicable when the UE selects Random Access resources indicating Msg3 repetition in this BWP. If this field is absent when the set(s) of Random Access resources with MSG3 repetition indication are configured in the <i>BWP-UplinkCommon</i>, the UE shall apply the values {0, 1, 2, 3, 4, 5, 6, 7} (see TS 38.214 [19], clause 6.1.4).</p>                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>msgA-ConfigCommon</i></b><br/>Configuration of the cell specific PRACH and PUSCH resource parameters for transmission of MsgA in 2-step random access type procedure. The NW can configure <i>msgA-ConfigCommon</i> only for UL BWPs if the linked DL BWPs (same bwp-Id as UL-BWP) are the initial DL BWPs or DL BWPs containing the SSB associated to the initial DL BWP or DL BWPs associated with <i>nonCellDefiningSSB</i> or, for (e)RedCap UEs, the RedCap-specific initial downlink BWP. The network configures <i>msgA-ConfigCommon</i> (without suffix) and/or <i>msgA-ConfigCommon-r17</i>, whenever it configures contention free 2-step random access, the UE then applies the corresponding configuration depending on the RACH resource set selected upon RACH initialization, as specified in TS 38.321 [3].</p>                                                                                                                                                       |
| <p><b><i>numberOfMsg3-RepetitionsList</i></b><br/>The number of repetitions for PUSCH transmission scheduled by RAR UL grant and DCI format 0_0 with CRC scrambled by TC-RNTI. This field is only applicable when the UE selects Random Access resources indicating Msg3 repetition in this BWP. If this field is absent when the set(s) of Random Access resources with MSG3 repetition indication are configured in the <i>BWP-UplinkCommon</i>, the UE shall apply the values {n1, n2, n3, n4} (see TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>preambleTransMax-Msg1-Repetition</i></b><br/>Max number of transmissions of MSG1 repetitions number (2, 4 and 8) performed before switching to higher repetition number (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when more than one repetition numbers are configured in shared RO. If the field is absent, switching from lower repetition number to higher repetition number is not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <p><b><i>pusch-ConfigCommon</i></b><br/>Cell specific parameters for the PUSCH of this BWP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

***rach-ConfigCommon***

Configuration of cell specific random access parameters which the UE uses for contention based and contention free random access as well as for contention based beam failure recovery in this BWP. The NW configures SSB-based RA (and hence *RACH-ConfigCommon*) only for UL BWPs if the linked DL BWPs (same *bwp-Id* as UL-BWP) are the initial DL BWPs or DL BWPs containing the SSB associated to the initial DL BWP or DL BWPs associated with *nonCellDefiningSSB* or, for (e)RedCap UEs, the RedCap-specific initial downlink BWP. The network configures *rach-ConfigCommon* (without suffix) and/or *rach-ConfigCommon-r17*, whenever it configures contention free 4-step random access (e.g. for reconfiguration with sync or for beam failure recovery or PDCCH order), the UE then applies the corresponding configuration depending on the RACH resource set selected upon RACH initialization, as specified in TS 38.321 [3]. For RedCap-specific initial uplink BWP, *rach-ConfigCommon* is always configured when *msgA-ConfigCommon* is configured in this BWP.

***rach-ConfigCommonIAB***

Configuration of cell specific random access parameters for the IAB-MT. The IAB specific IAB RACH configuration is used by IAB-MT, if configured.

***rsrp-ThresholdMsg1-RepetitionNum2, rsrp-ThresholdMsg1-RepetitionNum4, rsrp-ThresholdMsg1-RepetitionNum8***

Threshold used by the UE for determining whether to select resources indicating Msg1 repetition number 2, 4 or 8 in this BWP, as specified in TS 38.321 [3]. The value applies to all the BWPs and all RACH configurations. For a given MSG1 repetition number, this corresponding field is mandatory if both set(s) of Random Access resources with MSG1 repetition indication associated with this MSG1 repetition number and set(s) of Random Access resources without MSG1 repetition indication are configured in the BWP, or if the set(s) of Random Access resources with MSG1 repetition indication associated with this MSG1 repetition number and set(s) of Random Access resources with MSG1 repetition indication associated with a lower repetition number are configured in the BWP. It is absent otherwise.

***rsrp-ThresholdMsg3***

Threshold used by the UE for determining whether to select resources indicating Msg3 repetition in this BWP, as specified in TS 38.321 [3]. The field is mandatory if both set(s) of Random Access resources with MSG3 repetition indication and set(s) of Random Access resources without MSG3 repetition indication are configured in the BWP. It is absent otherwise.

***useInterlacePUCCH-PUSCH***

If the field is present, the UE uses uplink frequency domain resource allocation Type 2 for cell-specific PUSCH, e.g., PUSCH scheduled by RAR UL grant (see TS 38.213 [13] clause 8.3 and TS 38.214 [19], clause 6.1.2.2) and uses interlaced PUCCH Format 0 and 1 for cell-specific PUCCH (see TS 38.213 [13], clause 9.2.1).

| Conditional Presence  | Explanation                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Msg1Rep1</i>       | This field is optionally present, Need R, if the set(s) of Random Access resources with MSG1 repetition indication are configured in the <i>BWP-UplinkCommon</i> . It is absent otherwise.                                                               |
| <i>Msg3Rep</i>        | This field is optionally present, Need S, if the set(s) of Random Access resources with MSG3 repetition indication are configured in the <i>BWP-UplinkCommon</i> . It is absent otherwise.                                                               |
| <i>RA-PrioSliceAI</i> | The field is optionally present in <i>SIB1</i> , Need R, if both parameters <i>ra-PrioritizationForAccessIdentity</i> and the <i>ra-PrioritizationForSlicing/ra-PrioritizationForSlicingTwoStep</i> are present in <i>SIB1</i> . It is absent otherwise. |
| <i>SpCellOnly2</i>    | The field is optionally present, Need M, in the <i>BWP-UplinkCommon</i> of an SpCell. It is absent otherwise.                                                                                                                                            |
| <i>2TA-Only</i>       | The field is optionally present, Need N in the <i>BWP-UplinkCommon</i> if <i>additionalPCI-ToAddModList</i> is present in <i>ServingCellConfig</i> and if <i>tag2</i> is present in <i>ServingCellConfig</i> . It is absent otherwise.                   |

– ***BWP-UplinkDedicated***

The IE *BWP-UplinkDedicated* is used to configure the dedicated (UE specific) parameters of an uplink BWP.

| <p><b>beamFailureRecoveryConfig</b><br/>Configuration of beam failure recovery. If <i>supplementaryUplink</i> is present, the field is present only in one of the uplink carriers, either UL or SUL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>configuredGrantConfig</b><br/>A Configured-Grant of <i>type1</i> or <i>type2</i>. It may be configured for UL or SUL but in case of <i>type1</i> not for both at a time. Except for reconfiguration with sync, the NW does not reconfigure <i>configuredGrantConfig</i> when there is an active configured uplink grant Type 2 (see TS 38.321 [3]). However, the NW may release the <i>configuredGrantConfig</i> at any time. Network can only configure configured grant in one BWP using either this field or <i>configuredGrantConfigToAddModList</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>configuredGrantConfigToAddModList</b><br/>Indicates a list of one or more configured grant configurations to be added or modified for one BWP. Except for reconfiguration with sync, the NW does not reconfigure a Type 2 configured grant configuration when it is active (see TS 38.321 [3]). The network configures multiple CG configurations for one BWP with either all configurations or no configuration configured with <i>cg-RetransmissionTimer-r16</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>configuredGrantConfigToReleaseList</b><br/>Indicates a list of one or more UL Configured Grant configurations to be released. The NW may release a configured grant configuration at any time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>configuredGrantConfigType2DeactivationStateList</b><br/>Indicates a list of the deactivation states in which each state can be mapped to a single or multiple Configured Grant type 2 configurations to be deactivated when the corresponding deactivation DCI is received, see clause 7.3.1 in TS 38.212 [17] and clause 10.2 in TS 38.213 [13].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>cp-ExtensionC2, cp-ExtensionC3</b><br/>Configures the cyclic prefix (CP) extension (see TS 38.211 [16], clause 5.3.1). For 15 kHz SCS, {1..28} are valid for both <i>cp-ExtensionC2</i> and <i>cp-ExtensionC3</i>. For 30 kHz SCS, {1..28} are valid for <i>cp-ExtensionC2</i> and {2..28} are valid for <i>cp-ExtensionC3</i>. For 60 kHz SCS, {2..28} are valid for <i>cp-ExtensionC2</i> and {3..28} are valid for <i>cp-ExtensionC3</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p><b>lbt-FailureRecoveryConfig</b><br/>Configures parameters used for detection of consistent uplink LBT failures for operation with shared spectrum channel access, as specified in TS 38.321 [3].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>pathlossReferenceRSToAddModList</b><br/>A list of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for path loss estimation for PUSCH, PUCCH and SRS for unified TCI state operation. If <i>unifiedTCI-StateType</i> is not configured for the serving cell, no element in this list is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>pucch-Config</b><br/>PUCCH configuration for one BWP of the normal UL or SUL of a serving cell. If the UE is configured with SUL, the network configures PUCCH only on the BWPs of one of the uplinks (normal UL or SUL). The network configures <i>PUCCH-Config</i> at least on non-initial BWP(s) for SpCell and on all BWP(s) for PUCCH SCell. If supported by the UE, the network may configure at most one additional SCell of a cell group with <i>PUCCH-Config</i> (i.e. PUCCH SCell). If PUCCH cell switching is supported by the UE, the network may configure two TDD serving cells with <i>PUCCH-Config</i> within each PUCCH group. For supporting PUCCH cell switching in the PUCCH group with the SpCell, the TDD SpCell and one TDD SCell shall have <i>PUCCH-Config</i> on their normal UL. For supporting PUCCH cell switching in the PUCCH group with only SCells, two TDD SCells shall have <i>PUCCH-Config</i> on their normal UL.<br/>In (NG)EN-DC and NE-DC, the NW configures at most one serving cell per frequency range with PUCCH. In (NG)EN-DC and NE-DC, if two PUCCH groups are configured, the serving cells of the NR PUCCH group in FR2 use the same numerology. For NR-DC, the maximum number of PUCCH groups in each cell group is one, and only the same numerology is supported for the cell group with carriers only in FR2.<br/>The NW may configure PUCCH for a BWP when setting up the BWP. The network may also add/remove the <i>pucch-Config</i> in an <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> (for SpCell or PUCCH SCell) or with SCell release and add (for PUCCH SCell) to move the PUCCH between the UL and SUL carrier of one serving cell. In other cases, only modifications of a previously configured <i>pucch-Config</i> are allowed.<br/>If one (S)UL BWP of a serving cell is configured with PUCCH, all other (S)UL BWPs must be configured with PUCCH, too.</p> |
| <p><b>pucch-ConfigurationList</b><br/>PUCCH configurations for two simultaneously constructed HARQ-ACK codebooks (see TS 38.213 [13], clause 9.1). Different PUCCH Resource IDs are configured in different <i>PUCCH-Config</i> within the <i>pucch-ConfigurationList</i> if configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p><b>pucch-ConfigurationListMulticast1</b><br/>PUCCH configurations for two simultaneously constructed HARQ-ACK codebooks for MBS multicast (see TS 38.213, clause 9).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| If the field is present, the UE uses uplink frequency domain resource allocation Type 2 for PUSCH (see TS 38.213 [13], clause 8.3 and TS 38.214 [19], clause 6.1.2.2) and uses interlaced PUCCH Format 0, 1, 2, and 3 for PUCCH (see TS 38.213 [13], clause 9.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Conditional Presence | Explanation                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>NoTCI-PC</i>      | The field is mandatory present if <i>unifiedTCI-StateType</i> is configured for this serving cell and <i>ul-powerControl</i> is not configured for any UL TCI state or joint TCI state of this serving cell. Otherwise it is absent, Need R |
| <i>SpCellOnly</i>    | The field is optionally present, Need M, in the <i>BWP-UplinkDedicated</i> of an SpCell. It is absent otherwise.                                                                                                                            |

NOTE 1: In case of *RRCReconfiguration* with *reconfigurationWithSync*, the UE performs a MAC reset, which involves releasing the PUCCH-CSI/SRS/SR configuration in accordance with clause 5.3.12 and TS 38.321 [3], clauses 5.12 and 5.2. Hence, for these parts of the dedicated radio resource configuration, delta signalling is not supported in the message when *reconfigurationWithSync* is included.

## – CandidateBeamRS

The IE *CandidateBeamRS* includes candidate beams for beam failure recovery in case of beam failure detection. See also TS 38.321 [3], clause 5.17.

CandidateBeamRS information element

```
-- ASN1START
-- TAG-CANDIDATEBEAMRS-START

|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-RS-Index</b>                             | Indicates an <i>NZP-CSI-RS-Resource</i> of the LTM candidate that includes this <i>CandidateTCI-UL-State</i> .                                                                                                                                                                                                                                                                      |
| <b>pathlossReferenceRS-Id</b>                   | Indicates a <i>PathlossReferenceRS</i> of the LTM candidate that includes this <i>CandidateTCI-UL-State</i> and it refers to one of the <i>PathlossReferenceRS</i> configured within <i>LTM-TCI-Info</i> . In this version of the specification, only SSB can be included as reference signal when <i>PathlossReferenceRS</i> is included within a <i>CandidateTCI-UL-State</i> IE. |
| <b>referenceSignal</b>                          | Reference signal with which spatial relation information is provided. The field <i>csi-RS-Index</i> refers to one of the <i>NZP-CSI-RS-Resource</i> configured within <i>LTM-TCI-Info</i> .                                                                                                                                                                                         |
| <b>ssb-Index</b>                                | The index of a SSB/PBCH block as indicated in <i>ltn-SSB-Config</i> of the LTM candidate that includes this <i>CandidateTCI-UL-State</i> .                                                                                                                                                                                                                                          |
| <b>tci-UL-StateID</b>                           | The ID number of the uplink TCI state.                                                                                                                                                                                                                                                                                                                                              |
| <b>ul-PowerControl</b>                          | Indicates the UL power control parameters for PUSCH, PUCCH, and SRS of the candidate that includes this <i>CandidateTCI-UL-State</i> . This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the <i>SpCellConfig</i> of the <i>ltn-CandidateConfig</i> in the <i>LTM-Candidate</i> where the <i>ltn-TCI-Info</i> is configured.    |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2TA                  | This field is mandatory present if <i>tag2</i> is present in the <i>SpCellConfig</i> in <i>ltn-CandidateConfig</i> . It is absent, Need R, otherwise.                                                                                                                                                                       |
| <i>separateTCI</i>   | This field is mandatory present if <i>unifiedTCI-StateType</i> in the <i>ltn-TCI-Info</i> within <i>LTM-Candidate</i> is set to <i>separate</i> and <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of the <i>SpCellConfig</i> in <i>ltn-CandidateConfig</i> . It is absent, Need R, otherwise. |

## — CellAccessRelatedInfo

The IE *CellAccessRelatedInfo* indicates cell access related information for this cell.

| <b>cellReservedForFutureUse</b><br>Indicates whether the cell is reserved, as defined in 38.304 [20] for future use. The field is applicable to all PLMNs and NPNs. This field is ignored by IAB-MT and NCR-MT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>cellReservedForOtherUse</b><br>Indicates whether the cell is reserved, as defined in 38.304 [20]. The field is applicable to all PLMNs. This field is ignored by IAB-MT and NCR-MT for cell barring determination, but still considered by NPN capable IAB-MT and NPN capable NCR-MT for determination of an NPN-only cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>nnp-IdentityInfoList</b><br>The <i>nnp-IdentityInfoList</i> is used to configure a set of <i>NPN-IdentityInfo</i> elements. Each of those elements contains a list of one or more NPN Identities and additional information associated with those NPNs. The total number of PLMNs (identified by a PLMN identity in <i>plmn-IdentityList</i> ), PNI-NPNs (identified by a PLMN identity and a CAG-ID), and SNPNs (identified by a PLMN identity and a NID) together in the <i>PLMN-IdentityInfoList</i> and <i>NPN-IdentityInfoList</i> does not exceed 12, except for the NPN-only cells. A PNI-NPN and SNPN can be included only once, and in only one entry of the <i>NPN-IdentityInfoList</i> . In case of NPN-only cells the <i>PLMN-IdentityList</i> contains a single element that does not count to the limit of 12 and the <i>cellIdentity</i> of the first entry of the <i>PLMN-IdentityInfoList</i> is set to the same value as the <i>cellIdentity-r16</i> of the first entry of the <i>NPN-IdentityInfoList</i> . The NPN index is defined as $B+c1+c2+...+c(n-1)+d1+d2+...+d(m-1)+e(i)$ for the NPN identity included in the <i>n</i> -th entry of <i>NPN-IdentityInfoList</i> and in the <i>m</i> -th entry of <i>nnp-Identitylist</i> within that <i>NPN-IdentityInfoList</i> entry, and the <i>i</i> -th entry of its corresponding <i>NPN-Identity</i> , where <ul style="list-style-type: none"> <li>- <i>B</i> is the index used for the last PLMN in the <i>PLMN-IdentityInfoList</i>; in NPN-only cells <i>B</i> is considered 0;</li> <li>- <i>c(j)</i> is the number of NPN index values used in the <i>j</i>-th <i>NPN-IdentityInfoList</i> entry;</li> <li>- <i>d(k)</i> is the number of NPN index values used in the <i>k</i>-th <i>nnp-IdentityList</i> entry within the <i>n</i>-th <i>NPN-IdentityInfoList</i> entry;</li> <li>- <i>e(i)</i> is <ul style="list-style-type: none"> <li>- <i>i</i> if the <i>n</i>-th entry of <i>NPN-IdentityInfoList</i> entry is for SNPN(s);</li> <li>- 1 if the <i>n</i>-th entry of <i>NPN-IdentityInfoList</i> entry is for PNI-NPN(s).</li> </ul> </li> </ul> |
| <b>plmn-IdentityInfoList</b><br>The <i>plmn-IdentityInfoList</i> is used to configure a set of <i>PLMN-IdentityInfo</i> elements. Each of those elements contains a list of one or more PLMN Identities and additional information associated with those PLMNs. A PLMN-identity can be included only once, and in only one entry of the <i>PLMN-IdentityInfoList</i> . The PLMN index is defined as $b1+b2+...+b(n-1)+i$ for the PLMN included at the <i>n</i> -th entry of <i>PLMN-IdentityInfoList</i> and the <i>i</i> -th entry of its corresponding <i>PLMN-IdentityInfo</i> , where <i>b(j)</i> is the number of <i>PLMN-Identity</i> entries in each <i>PLMN-IdentityInfo</i> , respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>snnp-AccessInfoList</b><br>This list provides access related information for each SNPN in <i>nnp-IdentityInfoList</i> , see TS 23.501 [32]. The <i>n</i> -th entry of the list contains the access related information of the <i>n</i> -th SNPN in <i>nnp-IdentityInfoList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## – *CellGroupConfig*

The *CellGroupConfig* IE is used to configure a master cell group (MCG) or secondary cell group (SCG). A cell group comprises of one MAC entity, a set of logical channels with associated RLC entities and of a primary cell (SpCell) and one or more secondary cells (SCells). For an NCR-MT, the *CellGroupConfig* IE is also used to provide the configuration of side control information for the NCR-Fwd access link.

#### ***AutonomousDenialParamters field descriptions***

##### ***autonomousDenialSlots***

Indicates the maximum number of the UL slots for which the UE is allowed to deny any UL transmission. Value *n2* corresponds to 2 slots, value *n5* to 5 slots and so on.

##### ***autonomousDenialValidity***

Indicates the validity period over which the UL autonomous denial slots shall be counted. Value *n200* corresponds to 200 slots, value *n500* corresponds to 500 slots and so on.

| CC-State field descriptions |                                                                                                        |

| Enables reporting of uplink Direct Current location information when the UE is configured with intra-band CA. This field is absent in the IE <i>CellGroupConfig</i> when provided as part of <i>RRCSetup</i> message. The UE only reports the uplink Direct Current location information that are related to the indicated <i>cc-CombinationList</i> . The network does not include carriers which locate in DL only spectrum described in TS 38.101-2 [39], clause 5.3A.4 and defined by Fsd according to Table 5.3A.4-3 in FR2 in the <i>IntraBandCC-CombinationReqList</i> . I.e. DL-only carrier in FR2 frequency spectrum is not used to calculate the default DC location.                                                          |

| Indicates which option is configured for dynamic UL Tx switching for inter-band UL CA or (NG)EN-DC. The field is set to <i>switchedUL</i> if network configures option 1 as specified in TS 38.214 [19], or <i>dualUL</i> if network configures option 2 as specified in TS 38.214 [19]. Network always configures UE with a value for this field in inter-band UL CA case and (NG)EN-DC case where UE supports dynamic UL Tx switching.                                                                                                                                                                                                                                                                                                  |
| <b>uplinkTxSwitchingPowerBoosting</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Indicates whether the UE is allowed to enable 3dB boosting on the maximum output power for transmission on carrier2 under the operation state in which 2-port transmission can be supported on carrier2 for inter-band UL CA case with dynamic UL Tx switching as defined in TS 38.101-1 [15]. Network can only configure this field for dynamic UL Tx switching in inter-band UL CA case with power Class 3 as defined in TS 38.101-1 [15].                                                                                                                                                                                                                                                                                              |
| <b>uplinkTxSwitching-2T-Mode</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Indicates 2Tx-2Tx switching mode is configured for inter-band UL CA or SUL, in which the switching gap duration for a triggered uplink switching (as specified in TS 38.214 [19]) is equal to the switching time capability value reported for the switching mode.<br>If this field is absent and <i>uplinkTxSwitching</i> is configured, it is interpreted that 1Tx-2Tx UL Tx switching is configured as specified in TS 38.214 [19]. In this case, there is one uplink (or one uplink band in case of intra-band) configured with <i>uplinkTxSwitching</i> , on which the maximum number of antenna ports among all configured P-SRS/A-SRS and activated SP-SRS resources should be 1 and non-codebook based UL MIMO is not configured. |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

#### ***RACH-LessHO* field descriptions**

##### ***ssb-Index***

This field indicates a beam that the UE should use in the target cell to monitor PDCCH for initial uplink transmission, see TS 38.321 [3]. The network configures this field when *cg-RRC-Configuration* is not configured for the initial uplink transmission in RACH-less handover in NTN or in case this cell is not a mobile IAB cell.

##### ***targetNTA***

This field refers to the timing adjustment, see TS 38.213 [13] and TS 38.321 [3], indicating the  $N_{TA}$  value which the UE shall use for the target PTAG of handover. The value *zero* corresponds to  $N_{TA}=0$ , while the value *source* corresponds to the  $N_{TA}$  value of the source PTAG indicated by the *tag-Id*. Only value *source* is configured by the network in case source cell is a mobile IAB cell. In this version of the specification, the network shall always configure this field if *rach-LessHO* is part of an *RRCReconfiguration* message.

##### ***tci-StateID***

This field indicates a beam that the UE should use in the target cell to monitor PDCCH for initial uplink transmission and also indicates the TCI state information to be used in the target cell. The network configures this field in case this cell is not a NTN cell.

| <b><i>ReconfigurationWithSync</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IntraBandCC-Combination</b><br>Indicates the state of the carriers and BWPs indexes of the carriers in a CC combination, each carrier in this combination corresponds to an entry in <i>servCellIndexList</i> with same order. This IE shall have the same size as <i>servCellIndexList</i> . |
| <b>IntraBandCC-CombinationReqList</b><br>Indicates the list of the requested carriers/BWPs combinations for an intra-band CA component.                                                                                                                                                          |
| <b>servCellIndexList</b><br>indicates the list of cell index for an intra-band CA component.                                                                                                                                                                                                     |

| <b>SCellConfig field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>goodServingCellEvaluationBFD</b><br>Indicates the criterion for a UE to detect the good serving cell quality for BFD relaxation in an SCell in RRC_CONNECTED. This field is always configured when the network enables BFD relaxation for the UE in this SCell. This field is absent if <i>failureDetectionSetN</i> is present for the SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>preConfigGapStatus</b><br>Indicates whether the pre-configured measurement gaps (i.e. the gaps configured with <i>preConfigInd</i> ) are activated or deactivated while this SCell is deactivated. If this field is configured, the UE shall apply network-controlled mechanism for activation and deactivation of the pre-configured measurement gaps, otherwise the UE shall apply the autonomous activation/deactivation mechanism, as specified in TS 38.133 [14]. The first/leftmost bit corresponds to the measurement gap with gap ID 1, the second bit corresponds to measurement gap with gap ID 2, and so on. Value 0 indicates that the corresponding pre-configured measurement gap is deactivated while value 1 indicates that the corresponding pre-configured measurement gap is activated. The UE shall ignore the bit if the corresponding measurement gap is not a pre-configured measurement gap.         |
| <b>sCellState</b><br>Indicates whether the SCell shall be considered to be in activated state upon SCell configuration. If the field is included for an SCell configured with TRS for fast activation of the SCell, such TRS is not used for the corresponding SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>secondaryDRX-GroupConfig</b><br>The field is used to indicate whether the SCell belongs to the secondary DRX group. All serving cells in the secondary DRX group shall belong to one Frequency Range and all serving cells in the default DRX group shall belong to another Frequency Range. If <i>drx-ConfigSecondaryGroup</i> is configured, the field is optionally present. The network always includes the field if the field was previously configured for this SCell and the SCell remains in the secondary DRX group. Removal of an individual SCell from the secondary DRX group is supported by using an SCell release and addition. Otherwise, if <i>drx-ConfigSecondaryGroup</i> is not configured, the field is absent and the UE shall release the field. The UE shall also release the field if <i>drx-ConfigSecondaryGroup</i> is released without including <i>sCellToAddModList</i> .                      |
| <b>smtc</b><br>The SSB periodicity/offset/duration configuration of target cell for NR SCell addition. The network sets the <i>periodicityAndOffset</i> to indicate the same periodicity as <i>ssb-periodicityServingCell</i> in <i>sCellConfigCommon</i> . The <i>smtc</i> is based on the timing of the SpCell of associated cell group. In case of inter-RAT handover to NR, the timing reference is the NR PCell. In case of intra-NR PCell change (standalone NR) or NR PSCell change (EN-DC), the timing reference is the target SpCell. If the field is absent and <i>absoluteFrequencySSB</i> is included, the UE uses the SMTC in the <i>measObjectNR</i> having the same SSB frequency and subcarrier spacing, as configured before the reception of the RRC message. If the SCell is an SSB-less SCell (i.e., the IE <i>absoluteFrequencySSB</i> in <i>ServingCellConfigCommon</i> is absent), this field is absent. |

| <b>SpCellConfig field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>deactivatedSCG-Config</b><br>Configuration applicable when the SCG is deactivated. The network always configures this field before or when indicating that the SCG is deactivated in an <i>RRCReconfiguration</i> , <i>RRCResume</i> , E-UTRA <i>RRCCConnectionReconfiguration</i> or E-UTRA <i>RRCCConnectionResume</i> message.                                                                                                                                                                                                                                                                                            |
| <b>goodServingCellEvaluationBFD</b><br>Indicates the criterion for a UE to detect the good serving cell quality for BFD relaxation in the SpCell in RRC_CONNECTED. The field is always configured when the network enables BFD relaxation for the UE in this SpCell. This field is absent if <i>failureDetectionSetN</i> is present for the SpCell.                                                                                                                                                                                                                                                                             |
| <b>goodServingCellEvaluationRLM</b><br>Indicates the criterion for a UE to detect the good serving cell quality for RLM relaxation in the SpCell in RRC_CONNECTED. The field is always configured when the network enables RLM relaxation for the UE in this SpCell.                                                                                                                                                                                                                                                                                                                                                            |
| <b>lowMobilityEvaluationConnected</b><br>Indicates the criterion for a UE to detect low mobility in RRC_CONNECTED in an SpCell. The <i>s-SearchDeltaP-Connected</i> is the parameter "S <sub>SearchDeltaP-connected</sub> ". Value <i>dB3</i> corresponds to 3 dB, <i>dB6</i> corresponds to 6 dB and so on. The <i>t-SearchDeltaP-Connected</i> is the parameter "T <sub>SearchDeltaP-Connected</sub> ". Value <i>s5</i> means 5 seconds, value <i>s10</i> means 10 seconds and so on. Low mobility criterion is configured in NR PCell for the case of NR SA/ NR CA/ NE-DC/NR-DC, and in the NR PSCell for the case of EN-DC. |
| <b>reconfigurationWithSync</b><br>Parameters for the synchronous reconfiguration to the target SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>rll-TimersAndConstants</b><br>Timers and constants for detecting and triggering cell-level radio link failure. For the SCG, <i>rll-TimersAndConstants</i> can only be set to <i>setup</i> and is always included at SCG addition.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>servCellIndex</b><br>Serving cell ID of a PSCell. The PCell of the Master Cell Group uses ID = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>SL-PathSwitchConfig field descriptions</b>                                                                 |
|---------------------------------------------------------------------------------------------------------------|
| <b>targetRelayUE-Identity</b><br>Indicates the L2 source ID of the target L2 U2N Relay UE during path switch. |
| <b>t420</b><br>Indicates the timer value of <i>T420</i> to be used during path switch.                        |

| <b>UplinkTxSwitchingMoreBands field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>uplinkTxSwitchingBandList</b><br>Indicates the NR frequency band number of the UL bands for UL Tx switching. If the UE needs to determine location of switching period as specified in TS 38.101-1 [15], the UE considers that the bands are listed in decreasing order of priority, i.e. the first/leftmost entry corresponds to the band with the highest priority, the next entry corresponds to the band with the second highest priority, and so on. The last entry corresponds the band with the lowest priority. |
| <b>uplinkTxSwitchingBandPairList</b><br>Indicates the band pairs involved in UL Tx switching, as well as the per band pair configurations.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>uplinkTxSwitchingAssociatedBandDualUL-List</b><br>Indicates the associated band for the transmitting band indicated by <i>transmitBand</i> which the transmitting carrier(s) is on as specified in TS 38.214 [19], clause 6.1.6. The network ensures that each band pair of a transmitting band and an associated band supports the <i>dualUL</i> switching option.                                                                                                                                                     |
| <b>UplinkTxSwitchingBandIndex</b><br>The value <i>n</i> indicates the band included at the <i>n</i> -th entry of <i>uplinkTxSwitchingBandList</i> .                                                                                                                                                                                                                                                                                                                                                                        |

| <i>UplinkTxSwitchingBandPairConfig</i> field descriptions                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bandInfoUL1, bandInfoUL2</i></b><br>Indicates the band index for a band pair. The value n indicates the band included at the n-th entry of <i>uplinkTxSwitchingBandList</i> .                                                                                        |
| <b><i>switching2T-Mode</i></b><br>Indicates 2Tx-2Tx switching mode is configured to the band pair.<br>If this field is absent when uplink Tx switching is configured, it is interpreted that 1Tx-2Tx/1Tx-1Tx UL Tx switching is configured as specified in TS 38.214 [19]. |
| <b><i>switchingOptionConfigForBandPair</i></b><br>Indicates the switching option for the band pair as specified in TS 38.214 [19], clause 6.1.6.                                                                                                                           |
| <b><i>switchingPeriodConfigForBandPair</i></b><br>Indicates the value of switching period for the band pair as specified in TS 38.214 [19], clause 6.1.6. Value <i>n35us</i> represents 35 us, <i>n140us</i> represents 140us. If the field is absent, 210 us is applied.  |

| Conditional Presence               | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

NOTE: In case of change of AS security key derived from  $S\text{-}K_{\text{gNB}}/S\text{-}K_{\text{eNB}}$ , if *reconfigurationWithSync* is not included in the *masterCellGroup*, the network releases all existing MCG RLC bearers associated with a radio bearer with *keyToUse* set to *secondary*. In case of change of AS security key derived from  $K_{\text{gNB}}/K_{\text{eNB}}$ , if *reconfigurationWithSync* is not included in the *secondaryCellGroup*, the network releases all existing SCG RLC bearers associated with a radio bearer with *keyToUse* set to *master*.

## — *CellGroupId*

The IE *CellGroupId* is used to identify a cell group. Value 0 identifies the master cell group. Other values identify secondary cell groups. In this version of the specification only values 0 and 1 are supported.

### *CellGroupId* information element

```
-- ASN1START
-- TAG-CELLGROUPID-START

CellGroupId ::=                               INTEGER (0.. maxSecondaryCellGroups)

-- TAG-CELLGROUPID-STOP
-- ASN1STOP
```

## — *CellIdentity*

The IE *CellIdentity* is used to unambiguously identify a cell within a PLMN/SNP.

### *CellIdentity* information element

```
-- ASN1START
-- TAG-CELLIDENTITY-START

CellIdentity ::=                             BIT STRING (SIZE (36))

```

## — *CellReselectionPriority*

The IE *CellReselectionPriority* concerns the absolute priority of the concerned carrier frequency, as used by the cell reselection procedure. Corresponds to parameter "priority" in TS 38.304 [20]. Value 0 means lowest priority. The UE behaviour for the case the field is absent, if applicable, is specified in TS 38.304 [20].

***CellReselectionPriority* information element**

```
-- ASN1START
-- TAG-CELLRESELECTIONPRIORITY-START
```

```
CellReselectionPriority ::= INTEGER (0..7)
```

```
-- TAG-CELLRESELECTIONPRIORITY-STOP
-- ASN1STOP
```

— ***CellReselectionSubPriority***

The IE *CellReselectionSubPriority* indicates a fractional value to be added to the value of *cellReselectionPriority* to obtain the absolute priority of the concerned carrier frequency for E-UTRA and NR. Value *oDot2* corresponds to 0.2, value *oDot4* corresponds to 0.4 and so on.

***CellReselectionSubPriority* information element**

```
-- ASN1START
-- TAG-CELLRESELECTIONSUBPRIORITY-START
```

```
CellReselectionSubPriority ::= ENUMERATED {oDot2, oDot4, oDot6, oDot8}
```

```
-- TAG-CELLRESELECTIONSUBPRIORITY-STOP
-- ASN1STOP
```

— ***CFR-ConfigMulticast***

The IE *CFR-ConfigMulticast* indicates UE specific common frequency resource configuration for multicast for one dedicated BWP.

***CFR-ConfigMulticast* information element**

```
-- ASN1START
-- TAG-CFR-CONFIGMULTICAST-START
```

```

#### **CondExecutionCondToAddMod** field descriptions

##### **subsequentCondExecutionCond**

The execution condition that needs to be fulfilled in order to trigger the subsequent execution of a conditional reconfiguration for SN initiated intra-SN subsequent CPAC without MN involvement. When configuring 2 triggering events (Meas Ids) for a candidate cell, the network ensures that both refer to the same *measObject*. The network only indicates *MeasId*(s) associated with *condEventA3* or *condEventA5*.

##### **subsequentCondExecutionCondSCG**

Contains execution condition that needs to be fulfilled in order to trigger the subsequent execution of a conditional reconfiguration for SN initiated inter-SN subsequent CPAC, SN initiated intra-SN subsequent CPAC with MN involvement, or MN initiated subsequent CPAC. The Meas Ids refer to the *measConfig* associated with the SCG. When configuring 2 triggering events (Meas Ids) for a candidate cell, network ensures that both refer to the same *measObject*. The network only indicates *MeasId*(s) associated with *condEventA3* or *condEventA5*.

| Conditional Presence           | Explanation                                                                                                                                                                                                                        |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>condReconfigAdd</i>         | The field is mandatory present when a <i>condReconfigId</i> is being added. Otherwise the field is optional, need M.                                                                                                               |
| <i>condReconfigCHO-WithSCG</i> | This field is optional present, need M, if the <i>RRCReconfiguration</i> message contained in corresponding <i>condRRCReconfig</i> includes the <i>nr-SCG</i> and <i>condExecutionCond</i> is configured. Otherwise, it is absent. |
| <i>CPAC</i>                    | The field is optionally present, need M, when the conditional reconfiguration includes at least one candidate PSCell supporting subsequent CPAC. Otherwise, the field is absent, need R.                                           |

## – ConditionalReconfiguration

The IE *ConditionalReconfiguration* is used to add, modify and release the configuration of conditional reconfiguration.

| <i>ConditionalReconfiguration</i> field descriptions |                                                                                                                                                                                                                                                                |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>attemptCondReconfig</i></b>                    | If present, the UE shall perform conditional reconfiguration if selected cell is a target candidate cell and it is the first cell selection after failure as described in clause 5.3.7.3.                                                                      |
| <b><i>condReconfigToAddModList</i></b>               | List of the configuration of candidate SpCells to be added or modified for CHO, CPA, CPC or subsequent CPAC.                                                                                                                                                   |
| <b><i>condReconfigToRemoveList</i></b>               | List of the configuration of candidate SpCells to be removed.                                                                                                                                                                                                  |
| <b><i>scpac-ReferenceConfiguration</i></b>           | Includes the reference configuration for the candidate supporting subsequent CPAC.                                                                                                                                                                             |
| <b><i>servingSecurityCellSetId</i></b>               | This field identifies the security cell set for serving PSCell. The network does not provide this field for the conditional reconfiguration(s) generated by the SN.                                                                                            |
| <b><i>sk-counterConfiguration</i></b>                | Includes a list of <i>sk-Counter</i> from which the UE should select the <i>sk-counter</i> used to derive S-K <sub>gNB</sub> for inter-SN subsequent CPAC. The network does not provide this field for the conditional reconfiguration(s) generated by the SN. |

| Conditional Presence | Explanation                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>CHO</i>           | The field is optional present, Need R, if the UE is configured with at least a candidate SpCell for CHO. Otherwise the field is not present. |

## – *ConfiguredGrantConfig*

The IE *ConfiguredGrantConfig* is used to configure uplink transmission without dynamic grant according to two possible schemes. The actual uplink grant may either be configured via RRC (*type1*) or provided via the PDCCH (addressed to CS-RNTI) (*type2*). Multiple Configured Grant configurations may be configured in one BWP of a serving cell.

| <b>cg-COT-SharingList</b><br>Indicates a table for COT sharing combinations (see 37.213 [48], clause 4.1.3). One row of the table can be set to noCOT-Sharing to indicate that there is no channel occupancy sharing. If the <i>cg-RetransmissionTimer-r16</i> is configured and the UE operates as an initiating device in semi-static channel access mode (see TS 37.213 [48], clause 4.3), then <i>cg-COT-SharingList-r16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>cg-COT-SharingOffset</b><br>Indicates the offset from the end of the slot where the COT sharing indication in UCI is enabled where the offset in symbols is equal to $14 \cdot n$ , where $n$ is the signaled value for <i>cg-COT-SharingOffset</i> . Applicable when <i>ul-toDL-COT-SharingED-Threshold-r16</i> is not configured (see 37.213 [48], clause 4.1.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cg-DMRS-Configuration</b><br>DMRS configuration (see TS 38.214 [19], clause 6.1.2.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>cg-minDFI-Delay</b><br>Indicates the minimum duration (in unit of symbols) from the ending symbol of the PUSCH to the starting symbol of the PDCCH containing the downlink feedback indication (DFI) carrying HARQ-ACK for this PUSCH. The HARQ-ACK received before this minimum duration is not considered as valid for this PUSCH (see TS 38.213 [13], clause 10.5). The following minimum duration values are supported, depending on the configured subcarrier spacing [symbols]:<br>15 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4\}$<br>30 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4, 5, 6, 7, 8\}$<br>60 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$<br>120 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32\}$<br>480 kHz: $m \cdot 14$ , where $m = \{2, 4, 8, 12, 16, 20, 24, 28, 32, 36, 40, 44, 48, 52, 56, 60, 64, 68, 72, 76, 80, 84, 88, 92, 96, 100, 104, 108, 112, 116, 120, 124, 128\}$<br>960 kHz: $m \cdot 14$ , where $m = \{4, 8, 16, 24, 32, 40, 48, 56, 64, 72, 80, 88, 96, 104, 112, 120, 128, 136, 144, 152, 160, 168, 176, 184, 192, 200, 208, 216, 224, 232, 240, 248, 256\}$ |
| <b>cg-nrofPUSCH-InSlot</b><br>Indicates the number of consecutive PUSCH configured to CG within a slot where the SLIV indicating the first PUSCH and additional PUSCH appended with the same length (see TS 38.214 [19], clause 6.1.2.3). The network can only configure this field if <i>cg-RetransmissionTimer</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>cg-nrofSlots</b><br>Indicates the number of allocated slots in a configured grant periodicity following the time instance of configured grant offset (see TS 38.214 [19], clause 6.1.2.3). <i>cg-nrofSlots-r17</i> is only applicable for operation with shared spectrum channel access in FR2-2. When <i>cg-nrofSlots-r17</i> is configured, the UE shall ignore <i>cg-nrofSlots-r16</i> . The network can only configure this field if <i>cg-RetransmissionTimer</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Indicates the initial value of the configured grant timer (see TS 38.321 [3]) in multiples of <i>periodicity</i> . When <i>cg-RetransmissionTimer</i> is configured, if HARQ processes are shared among different configured grants on the same BWP, <i>configuredGrantTimer * periodicity</i> is set to the same value for the configurations that share HARQ processes on this BWP. The value of the extension <i>configuredGrantTimer</i> is 2 times the configured value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Indicates the frequency hopping scheme for Type 1 CG when <i>pusch-RepTypeIndicator</i> is set to 'pusch-RepTypeB' (see TS 38.214 [19], clause 6.1). The value <i>interRepetition</i> enables 'Inter-repetition frequency hopping', and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. If the field is absent, the frequency hopping is not enabled for Type 1 CG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <p><b>precodingAndNumberOfLayers2</b></p> <p>Indicates the precoding and number of layers for the second SRS resource set. When this field is present, <i>precodingAndNumberOfLayers</i> indicated the precoding and number of layers for the first SRS resource set. Network does not configure this field if <i>cg-RRC-Configuration</i> is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>pusch-RepTypeIndicator</b></p> <p>Indicates whether UE follows the behavior for PUSCH repetition type A or the behavior for PUSCH repetition type B for each Type 1 configured grant configuration. The value <i>pusch-RepTypeA</i> enables the 'PUSCH repetition type A' and the value <i>pusch-RepTypeB</i> enables the 'PUSCH repetition type B' (see TS 38.214 [19], clause 6.1.2.3). The value <i>pusch-RepTypeB</i> is not configured simultaneously with <i>nrofSlotsInCG-Period-r18</i>. The network does not configure this field if <i>cg-RetransmissionTimer-r16</i> is configured for CG operation with shared spectrum channel access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>rbg-Size</b></p> <p>Selection between configuration 1 and configuration 2 for RBG size for PUSCH. The UE does not apply this field if <i>resourceAllocation</i> is set to <i>resourceAllocationType1</i>. Otherwise, the UE applies the value <i>config1</i> when the field is absent. Note: <i>rbg-Size</i> is used when the <i>transformPrecoder</i> parameter is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>repK-RV</b><br>The redundancy version (RV) sequence to use. See TS 38.214 [19], clause 6.1.2. The network configures this field if repetitions are used, i.e., if <i>repK</i> is set to <i>n2</i> , <i>n4</i> or <i>n8</i> . This field is not configured when <i>cg-RetransmissionTimer</i> is configured. Otherwise, the field is absent.                                                                                                                                                                                 |
| <b>repK</b><br>Number of repetitions K, see TS 38.214 [19]. If the field <i>repK-v1710</i> is present, the UE shall ignore the <i>repK</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                   |
| <b>resourceAllocation</b><br>Configuration of resource allocation type 0 and resource allocation type 1. For Type 1 UL data transmission without grant, <i>resourceAllocation</i> should be <i>resourceAllocationType0</i> or <i>resourceAllocationType1</i> .                                                                                                                                                                                                                                                                 |
| <b>rrc-ConfiguredUplinkGrant</b><br>Configuration for "configured grant" transmission with fully RRC-configured UL grant (Type1). If this field is absent the UE uses UL grant configured by DCI addressed to CS-RNTI (Type2).                                                                                                                                                                                                                                                                                                 |
| <b>sequenceOffsetForRV</b><br>Configures the RV offset for the starting RV for the first repetition (first actual repetition in PUSCH repetition Type B) towards the second 'SRS resource set' for PUSCH configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'.                                                                                                                                                                          |
| <b>srs-ResourceSetId</b><br>Indicates the associated SRS resource set for PUSCH+PUSCH simultaneous uplink transmission for CG-type 1 PUSCH. Network does not configure this field if <i>cg-RRC-Configuration</i> is configured.                                                                                                                                                                                                                                                                                                |
| <b>srs-ResourceIndicator, srs-ResourceIndicator-v1850</b><br>Indicates the SRS resource to be used (see TS 38.212 [17], clause 7.3.1.1.2, and TS 38.214 [19], clause 6.1.2.3). The network does not configure this for CG-SDT or if <i>cg-RRC-Configuration</i> is configured. Field <i>srs-ResourceIndicator-v1850</i> is only configured when 8 antenna ports are configured (see TS 38.214 [19], clause 6.1.1.2). The network does not configure both <i>srs-ResourceIndicator</i> and <i>srs-ResourceIndicator-v1850</i> . |
| <b>srs-ResourceIndicator2</b><br>Indicates the SRS resource to be used for the second SRS resource set. When this field is present, the <i>srs-ResourceIndicator</i> is used for the first SRS resource set. Network does not configure this field if <i>cg-RRC-Configuration</i> is configured.                                                                                                                                                                                                                               |
| <b>startingFromRV0</b><br>This field is used to determine the initial transmission occasion of a transport block for a given RV sequence, see TS 38.214 [19], clause 6.1.2.3.1. The network does not configure this field if <i>cg-RetransmissionTimer-r16</i> is configured for CG operation.                                                                                                                                                                                                                                 |
| <b>timeDomainAllocation, timeDomainAllocation-v1710</b><br>Indicates a combination of start symbol and length and PUSCH mapping type, see TS 38.214 [19], clause 6.1.2 and TS 38.212 [17], clause 7.3.1. If the field <i>timeDomainAllocation-v1710</i> is present, the UE shall ignore <i>timeDomainAllocation</i> field (without suffix).                                                                                                                                                                                    |
| <b>timeDomainOffset</b><br>Offset related to the reference SFN indicated by <i>timeReferenceSFN</i> , see TS 38.321 [3], clause 5.8.2. <i>timeDomainOffset-r17</i> is only applicable to 480 kHz and 960 kHz. If <i>timeDomainOffset-r17</i> is present, the UE shall ignore <i>timeDomainOffset</i> (without suffix).                                                                                                                                                                                                         |
| <b>timeReferenceHyperSFN</b><br>Indicates H-SFN used for determination of the offset of a resource in time domain. The UE uses the closest H-SFN with the indicated number preceding the reception of the configured grant configuration, see TS 38.321 [3], clause 5.8.2. If the field <i>timeReferenceHyperSFN</i> is not present, the reference hyper SFN is 0.                                                                                                                                                             |
| <b>timeReferenceSFN</b><br>Indicates SFN used for determination of the offset of a resource in time domain. The UE uses the closest SFN with the indicated number preceding the reception of the configured grant configuration, see TS 38.321 [3], clause 5.8.2. If the field <i>timeReferenceSFN</i> is not present, the reference SFN is 0.                                                                                                                                                                                 |
| <b>transformPrecoder</b><br>Enables or disables transform precoding for <i>type1</i> and <i>type2</i> . If the field is absent, the UE enables or disables transform precoding in accordance with the field <i>msg3-transformPrecoder</i> in <i>RACH-ConfigCommon</i> from <i>rach-ConfigCommon</i> included directly within BWP configuration (i.e., not included in <i>additionalRACH-ConfigList</i> ), see TS 38.214 [19], clause 6.1.3.                                                                                    |
| <b>uci-OnPUSCH</b><br>Selection between and configuration of dynamic and semi-static beta-offset. For Type 1 UL data transmission without grant, <i>uci-OnPUSCH</i> should be set to <i>semiStatic</i> . The network does not configure this for CG-SDT.                                                                                                                                                                                                                                                                       |

| <b>CG-COT-Sharing field descriptions</b>                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channelAccessPriority</b><br>Indicates the Channel Access Priority Class that the gNB can assume when sharing the UE initiated COT (see 37.213 [48], clause 4.1.3).                |
| <b>duration</b><br>Indicates the number of DL transmission slots within UE initiated COT (see 37.213 [48], clause 4.1.3).                                                             |
| <b>offset</b><br>Indicates the number of DL transmission slots from the end of the slot where CG-UCI is detected after which COT sharing can be used (see 37.213 [48], clause 4.1.3). |

| <b>CG-StartingOffsets field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cg-StartingFullBW-InsideCOT</b><br>A set of configured grant PUSCH transmission starting offsets (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation includes all interlaces in the allocated RB set(s) and the CG PUSCH resource is inside gNB COT (see TS 38.214 [19], clause 6.1.2.3).                   |
| <b>cg-StartingFullBW-OutsideCOT</b><br>A set of configured grant PUSCH transmission starting offset indices (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation includes all interlaces in the allocated RB set(s) and the CG PUSCH resource is outside gNB COT (see TS 38.214 [19], clause 6.1.2.3).          |
| <b>cg-StartingPartialBW-InsideCOT</b><br>A set of configured grant PUSCH transmission starting offset index (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation does not include all interlaces in the allocated RB set(s) and the CG PUSCH resource is inside gNB COT (see TS 38.214 [19], clause 6.1.2.3).   |
| <b>cg-StartingPartialBW-OutsideCOT</b><br>A set of configured grant PUSCH transmission starting offset index (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation does not include all interlaces in the allocated RB set(s) and the CG PUSCH resource is outside gNB COT (see TS 38.214 [19], clause 6.1.2.3). |

| <b>CG-SDT-Configuration and CG-RRC-Configuration field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>cg-RRC-RSRP-ThresholdSSB</b><br/>An RSRP threshold configured for SSB selection for the CG as specified in TS 38.321 [3]. This field is absent in <i>cg-LTM-Configuration</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p><b>cg-SDT-RetransmissionTimer, cg-RRC-RetransmissionTimer</b><br/>Indicates the initial value of the configured grant retransmission timer used for the initial transmission of CG with CCCH (for CG-SDT) or DCCH message (see TS 38.321 [3]) in multiples of <i>periodicity</i>. The field <i>cg-RRC-RetransmissionTimer</i> is not configured together with the field <i>harq-ProclD-Offset</i> for operations in unlicensed spectrum.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>sdt-DMRS-Ports, rrc-DMRS-Ports</b><br/>Indicates the set of DMRS ports for SSB to PUSCH mapping (see TS 38.213 [13]). The first (left-most / most significant) bit corresponds to DMRS port 0, the second most significant bit corresponds to DMRS port 1, and so on. A bit set to 1 indicates that this DMRS port is used for mapping.<br/>For <i>sdt-DMRS-Ports</i>, in case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB. For <i>rrc-DMRS-Ports</i>, in case of the downlink BWP indicated by <i>firstActiveDownlinkBWP-Id</i> that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB.</p>                                                                                                                                                                                                                                                          |
| <p><b>sdt-NrofDMRS-Sequences, rrc-NrofDMRS-Sequences</b><br/>Indicates the number of DMRS sequences for SSB to PUSCH mapping (see TS 38.213 [13]).<br/>For <i>sdt-NrofDMRS-Sequences</i>, in case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB. For <i>rrc-NrofDMRS-Sequences</i>, in case of the downlink BWP indicated by <i>firstActiveDownlinkBWP-Id</i> that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b>sdt-SSB-Subset, rrc-SSB-Subset</b><br/>Indicates SSB subset for SSB to CG PUSCH mapping within one CG configuration. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not included in the SSB subset for SSB to CG PUSCH mapping while value 1 indicates that the corresponding SS/PBCH block is included in SSB subset for SSB to CG PUSCH mapping. If this field is absent, UE assumes the SSB set includes all actually transmitted SSBs.<br/>For <i>sdt-SSB-Subset</i>, in case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB. For <i>rrc-SSB-Subset</i>, in case of the downlink BWP indicated by <i>firstActiveDownlinkBWP-Id</i> that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB.</p> |
| <p><b>sdt-SSB-PerCG-PUSCH, rrc-SSB-PerCG-PUSCH</b><br/>The number of SSBs per CG PUSCH (see TS 38.213 [13]). Value <i>one</i> corresponds to 1 SSBs per CG PUSCH, value <i>two</i> corresponds to 2 SSBs per CG PUSCH and so on.<br/>For <i>sdt-SSB-PerCG-PUSCH</i>, in case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB. For <i>rrc-SSB-PerCG-PUSCH</i>, in case of the downlink BWP indicated by <i>firstActiveDownlinkBWP-Id</i> that is associated with NCD-SSB, the SSB is the NCD-SSB; otherwise, the SSB is the CD-SSB.</p>                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>sdt-P0-PUSCH, rrc-P0-PUSCH</b><br/>Indicates P0 value for PUSCH in steps of 1dB (see TS 38.213 [13]). When this field is configured, the UE ignores the <i>p0-PUSCH-Alpha</i>. This field is absent in <i>cg-LTM-Configuration</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>sdt-Alpha, rrc-Alpha</b><br/>Indicates alpha value for PUSCH. <i>alpha0</i> indicates value 0 is used, <i>alpha04</i> indicates value 4 is used and so on (see TS 38.213 [13]). When this field is configured, the UE ignores the <i>p0-PUSCH-Alpha</i>. This field is absent in <i>cg-LTM-Configuration</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Conditional Presence           | Explanation                                                                                                                                                                                                                                                                                                                                              |

Otherwise it is absent, Need R |

## – *ConfiguredGrantConfigIndex*

The IE *ConfiguredGrantConfigIndex* is used to indicate the index of one of multiple UL Configured Grant configurations in one BWP.

### ***ConfiguredGrantConfigIndex* information element**

```
-- ASN1START
-- TAG-CONFIGUREDGRANTCONFIGINDEX-START

ConfiguredGrantConfigIndex-r16 ::= INTEGER (0.. maxNrofConfiguredGrantConfig-1-r16)

-- TAG-CONFIGUREDGRANTCONFIGINDEX-STOP
-- ASN1STOP
```

## – *ConfiguredGrantConfigIndexMAC*

The IE *ConfiguredGrantConfigIndexMAC* is used to indicate the unique Configured Grant configurations index per MAC entity.

### ***ConfiguredGrantConfigIndexMAC* information element**

```
-- ASN1START
-- TAG-CONFIGUREDGRANTCONFIGINDEXMAC-START

ConfiguredGrantConfigIndexMAC-r16 ::= INTEGER (0.. maxNrofConfiguredGrantConfigMAC-1-r16)

-- TAG-CONFIGUREDGRANTCONFIGINDEXMAC-STOP
-- ASN1STOP
```

— ConnEstFailureControl

The IE *ConnEstFailureControl* is used to configure parameters for connection establishment failure control.

ConnEstFailureControl information element

```
-- ASN1START
-- TAG-CONNЕСТFAILURECONTROL-START

ConnEstFailureControl ::= SEQUENCE {
    connEstFailCount          ENUMERATED {n1, n2, n3, n4},
    connEstFailOffsetValidity ENUMERATED {s30, s60, s120, s240, s300, s420, s600, s900},
    connEstFailOffset         INTEGER (0..15)
}
-- TAG-CONNЕСТFAILURECONTROL-STOP
-- ASN1STOP
```

OPTIONAL -- Need S

| ConnEstFailureControl field descriptions                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connEstFailCount</b><br>Number of times that the UE detects T300 expiry on the same cell before applying <i>connEstFailOffset</i> .                                                                                                                     |
| <b>connEstFailOffset</b><br>Parameter "Qoffset <sub>temp</sub> " in TS 38.304 [20]. If the field is absent, the value of infinity shall be used for "Qoffset <sub>temp</sub> ".                                                                            |
| <b>connEstFailOffsetValidity</b><br>Amount of time that the UE applies <i>connEstFailOffset</i> before removing the offset from evaluation of the cell. Value <i>s30</i> corresponds to 30 seconds, value <i>s60</i> corresponds to 60 seconds, and so on. |

— ControlResourceSet

The IE *ControlResourceSet* is used to configure a time/frequency control resource set (CORESET) in which to search for downlink control information (see TS 38.213 [13], clause 10.1). For the UE not supporting *multipleCORESET* in FR1, in order to receive MBS multicast in CFR within the UE's active BWP, if a CORESET is not configured within the *PDCCH-ConfigMulticast*, the CORESET other than CORESET#0 configured within the UE's active BWP for scheduling unicast can be used for scheduling MBS multicast, and the CORESET is expected to be included completely within the CFR and the parameters configured in the CORESET are expected to be supported by the UE for MBS multicast.

ControlResourceSet information element

```

| <b>applyIndicatedTCI-State</b><br>This field indicates, for PDCCH reception on this CORESET, if UE applies the first, the second, both or none "indicated" DL only TCI or joint TCI as specified in TS 38.213 [13], clause 10.1. Value <i>both</i> can be configured only if <i>sfnSchemePDCCH</i> is configured in the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cce-REG-MappingType</b><br>Mapping of Control Channel Elements (CCE) to Resource Element Groups (REG) (see TS 38.211 [16], clauses 7.3.2.2 and 7.4.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>controlResourceSetId</b><br>Identifies the instance of the <i>ControlResourceSet</i> IE. Value 0 identifies the common CORESET configured in <i>MIB</i> and in <i>ServingCellConfigCommon</i> ( <i>controlResourceSetZero</i> ) and is hence not used here in the <i>ControlResourceSet</i> IE. Other values identify CORESETs configured by dedicated signalling or in <i>SIB1</i> or <i>SIB20</i> . The <i>controlResourceSetId</i> is unique among the BWPs of a serving cell.<br>If the field <i>controlResourceSetId-v1610</i> is present, the UE shall ignore the <i>controlResourceSetId</i> field (without suffix).                                                                                                                                                                                                                                  |
| <b>coresetPoolIndex</b><br>The index of the CORESET pool for this CORESET as specified in TS 38.213 [13] (clauses 9 and 10) and TS 38.214 [19] (clauses 5.1 and 6.1). If the field is absent, the UE applies the value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>duration</b><br>Contiguous time duration of the CORESET in number of symbols (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>followUnifiedTCI-State</b><br>When set to enabled, for PDCCH reception on this CORESET, the UE applies the "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>frequencyDomainResources</b><br>Frequency domain resources for the CORESET. Each bit corresponds a group of 6 RBs, with grouping starting from the first RB group in the BWP or MBS CFR where the CORESET is configured. When at least one search space is configured with <i>freqMonitorLocation-r16</i> , only the first $N_{\text{RBG, set0}}^{\text{size}}$ bits are valid (see TS 38.213 [13], clause 10.1). The first (left-most / most significant) bit corresponds to the first RB group in the BWP or MBS CFR where the CORESET is configured, and so on. A bit that is set to 1 indicates that this RB group belongs to the frequency domain resource of this CORESET. Bits corresponding to a group of RBs not fully contained in the bandwidth part within which the CORESET is configured are set to zero (see TS 38.211 [16], clause 7.3.2.2). |
| <b>interleaverSize</b><br>Interleaver-size (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>pdccch-DMRS-ScramblingID</b><br>PDCCH DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.3.1). When the field is absent the UE applies the value of the <i>physCellId</i> configured for this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>precoderGranularity</b><br>Precoder granularity in frequency domain (see TS 38.211 [16], clauses 7.3.2.2 and 7.4.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>rb-Offset</b><br>Indicates the RB level offset in units of RB from the first RB of the first 6RB group to the first RB of BWP (see 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>reg-BundleSize</b><br>Resource Element Groups (REGs) can be bundled to create REG bundles. This parameter defines the size of such bundles (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>shiftIndex</b><br>When the field is absent the UE applies the value of the <i>physCellId</i> configured for this serving cell (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>tcI-PresentInDCI</b><br>This field indicates if TCI field is present or absent in DCI format 1_1, DCI format 1_3 and DCI format 4_2. When the field is absent the UE considers the TCI to be absent/disabled. In case of cross carrier scheduling, the network sets this field to enabled for the <i>ControlResourceSet</i> used for cross carrier scheduling in DCI format 1_1 in the scheduling cell if <i>enableDefaultBeamForCCS</i> is not configured (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                                                                                                                               |
| <b>tcI-PresentDCI-1-2</b><br>Configures the number of bits for "Transmission configuration indicator" in DCI format 1_2. When the field is absent the UE applies the value of 0 bit for the "Transmission configuration indicator" in DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 5.1.5). In case of cross carrier scheduling, the network configures this field for the <i>ControlResourceSet</i> used for cross carrier scheduling in DCI format 1_2 in the scheduling cell if <i>enableDefaultBeamForCCS</i> is not configured (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                           |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <i>FollowUTCI</i>        | The field is absent if the field <i>followUnifiedTCI-State</i> is present or if more than one value for the field <i>coresetPoolIndex</i> is configured in <i>controlResourceSet</i> for the same bandwidthpart. Otherwise, it is optionally present, Need R. |
| <i>NotSIB-initialBWP</i> | The field is absent in <i>SIB1/SIB20</i> and in the <i>PDCCH-ConfigCommon</i> of the initial BWP in <i>ServingCellConfigCommon</i> , if <i>SIB1/SIB20</i> is broadcasted. Otherwise, it is optionally present, Need N.                                        |

–
 ***ControlResourceSetId***

The *ControlResourceSetId* IE concerns a short identity, used to identify a control resource set within a serving cell. The *ControlResourceSetId* = 0 identifies the *ControlResourceSet#0* configured via PBCH (*MIB*) and in *controlResourceSetZero* (*ServingCellConfigCommon*). The ID space is used across the BWPs and MBS CFRs of a Serving Cell.

***ControlResourceSetId* information element**

```

-- ASN1START
-- TAG-CONTROLRESOURCESETID-START

ControlResourceSetId ::=
    INTEGER (0..maxNrofControlResourceSets-1)

ControlResourceSetId-r16 ::=
    INTEGER (0..maxNrofControlResourceSets-1-r16)

ControlResourceSetId-v1610 ::=
    INTEGER (maxNrofControlResourceSets..maxNrofControlResourceSets-1-r16)

-- TAG-CONTROLRESOURCESETID-STOP
-- ASN1STOP

```

–
 ***ControlResourceSetZero***

The IE *ControlResourceSetZero* is used to configure CORESET#0 of the initial BWP (see TS 38.213 [13], clause 13).

***ControlResourceSetZero* information element**

```

-- ASN1START
-- TAG-CONTROLRESOURCESETZERO-START

ControlResourceSetZero ::=
    INTEGER (0..15)

-- TAG-CONTROLRESOURCESETZERO-STOP

```

```
-- ASN1STOP
```

## — *CrossCarrierSchedulingConfig*

The IE *CrossCarrierSchedulingConfig* is used to specify the configuration when the cross-carrier scheduling is used in a cell.

| <b>carrierIndicatorSizeDCI-0-2, carrierIndicatorSizeDCI-1-2</b><br>Configures the number of bits for the field of carrier indicator in PDCCH DCI format 0_2/1_2. The field <i>carrierIndicatorSizeDCI-0-2</i> refers to DCI format 0_2 and the field <i>carrierIndicatorSizeDCI-1-2</i> refers to DCI format 1_2, respectively (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |
| <b>ccs-BlindDetectionSplit</b><br>Indicates the share of blind detection candidates and non-overlapping CCEs for PDCCH monitoring on an SpCell and an SCell when cross-carrier scheduling is configured from the SCell for the SpCell (see TS 38.213 [13], clause 10.1.1). The network only configures this field when it sets the field <i>other</i> for an SpCell, i.e., when it configures cross-carrier scheduling of the SpCell by a PDCCH on an SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>cif-Presence</b><br>The field is used to indicate whether carrier indicator field is present (value <i>true</i> ) or not (value <i>false</i> ) in PDCCH DCI formats, see TS 38.213 [13]. If <i>cif-Presence</i> is set to <i>true</i> , the CIF value indicating a grant or assignment for this cell is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |
| <b>cif-InSchedulingCell</b><br>The field indicates the CIF value used in the scheduling cell to indicate a grant or assignment applicable for this cell, see TS 38.213 [13]. If configured for an SpCell, the non-fallback DCI formats on the SpCell include same number of CIF bits as the corresponding non-fallback DCI formats on the scheduling cell, and the CIF bits are considered reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| <b>enableDefaultBeamForCCS</b><br>This field indicates whether default beam selection for cross-carrier scheduled PDSCH or aperiodic CSI-RS is enabled, see TS 38.214 [19]. If not present, the default beam selection behaviour is not applied, i.e. Rel-15 behaviour is applied. This field can only be configured in the cross-scheduled SCell or SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>other</b><br>Parameters for cross-carrier scheduling. If configured for an SpCell, the SpCell can be scheduled by the PDCCH on another SCell as well as by the PDCCH on the SpCell. If configured for an SCell, the SCell is scheduled by a PDCCH on another cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
| <b>own</b><br>Parameters for self-scheduling, i.e., a serving cell is scheduled by its own PDCCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
| <b>schedulingCellId</b><br>If configured for an SpCell, this field indicates which SCell, in addition to the SpCell, signals the downlink allocations and uplink grants, if applicable, for the concerned SpCell. If configured for an SCell, this field indicates which cell signals the downlink allocations and uplink grants, if applicable, for the concerned SCell. In case the UE is configured with DC, the scheduling cell is part of the same cell group (i.e. MCG or SCG) as the scheduled cell. In case the UE is configured with two PUCCH groups, the scheduling cell and the scheduled cell are within the same PUCCH group. If <i>drx-ConfigSecondaryGroup</i> is configured in the <i>MAC-CellGroupConfig</i> associated with this serving cell, the scheduling cell and the scheduled cell belong to the same Frequency Range. In addition, the serving cell with an aperiodic CSI trigger and the PUSCH resource scheduled for the report are on the same carrier and serving cell, but the cell for which CSI is reported may belong to the same or a different Frequency Range. The network should not trigger a CSI request for a serving cell in the other Frequency Range when that serving cell is outside Active Time. |  |

| Conditional Presence | Explanation                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| CIF-PRESENCE         | The field is mandatory present if the <i>cif-Presence</i> is set to <i>true</i> . The field is absent otherwise. |

## – CSI-AperiodicTriggerStateList

The *CSI-AperiodicTriggerStateList* IE is used to configure the UE with a list of aperiodic trigger states. Each codepoint of the DCI field "CSI request" is associated with one trigger state (see TS 38.321 [3], clause 6.1.3.13). Upon reception of the value associated with a trigger state, the UE will perform measurement of CSI-RS, CSI-IM and/or SSB (reference signals) and aperiodic reporting on L1 according to all entries in the *associatedReportConfigInfoList* for that trigger state.

### *CSI-AperiodicTriggerState field descriptions*

#### ***Itm-AssociatedReportConfigInfo***

This field configures the aperiodic CSI reports of LTM candidate cells. If *Itm-associatedReportConfigInfo* is configured the UE shall ignore the field *associatedReportConfigInfoList*.

| <b>CSI-AssociatedReportConfigInfo field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <p><b>qcl-info, qcl-info2</b><br/>Fields <i>qcl-Info</i> and <i>qcl-Info2</i> are lists of references to TCI-States for providing the QCL source and QCL type for each <i>NZP-CSI-RS-Resource</i> listed in <i>nzp-CSI-RS-Resources</i> of the <i>NZP-CSI-RS-ResourceSet</i>, indicated by <i>resourceSet</i> within <i>nzp-CSI-RS</i> and by <i>resourceSet2</i> within <i>nzp-CSI-RS2</i>, respectively. Each <i>TCI-StateId</i> refers to the <i>TCI-State</i> which has this value for <i>tcI-StateId</i> and is defined in <i>tcI-StatesToAddModList</i> or in <i>dl-OrJointTCI-StateList</i> in the <i>PDSCH-Config</i> included in the <i>BWP-Downlink</i> corresponding to the serving cell and to the DL BWP to which the <i>resourcesForChannelMeasurement</i> (in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above) belong to. First entry in <i>qcl-info/qcl-info2</i> corresponds to first entry in <i>nzp-CSI-RS-Resources</i> of that <i>NZP-CSI-RS-ResourceSet</i>, second entry in <i>qcl-info/qcl-info2</i> corresponds to second entry in <i>nzp-CSI-RS-Resources</i>, and so on (see TS 38.214 [19], clause 5.2.1.5.1). When this field is absent for aperiodic CSI RS, and <i>applyIndicatedTCI-State</i> or <i>applyIndicatedTCI-State2</i> is not configured, the UE shall use QCL information included in the "indicated" DL only/Joint TCI state as specified in TS 38.214 [19].</p> |
| <p><b>reportConfigId</b><br/>The <i>reportConfigId</i> of one of the <i>CSI-ReportConfigToAddMod</i> configured in <i>CSI-MeasConfig</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b>resourcesForChannel2</b><br/>Configures reference signals for channel measurement corresponding to the second resource set for L1-RSRP measurement as configured in IE <i>CSI-ResourceConfig</i> when <i>nrofReportedGroups-r17</i> is configured in IE <i>CSI-ReportConfig</i>. If this is present, network configures <i>csi-SSB-ResourceSetExt</i> instead of <i>csi-SSB-ResourceSet</i> and the UE ignores <i>csi-SSB-ResourceSet</i> in <i>resourcesForChannel</i>, and the <i>resourcesForChannel</i> configures the reference signals for channel measurement corresponding to the first resource set for L1-RSRP measurement (see TS 38.214 [19], clause 5.2.1.4).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>resourcesForChannelTDCP</b><br/>Configures reference signals for channel measurement corresponding to the second resource set and third resource set for TDCP reporting. All CSI resources of these two resource sets always share the same QCL-info with the resource sets indicated by <i>resourcesForChannel</i> as specified in TS 38.214 [19].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b>resourceSet, resourceSet2</b><br/><i>NZP-CSI-RS-ResourceSet</i> for channel measurements. Entry number in <i>nzp-CSI-RS-ResourceSetList</i> in the <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Conditional Presence              | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                            |

## – CSI-FrequencyOccupation

The IE *CSI-FrequencyOccupation* is used to configure the frequency domain occupation of a channel state information measurement resource (e.g. *NZP-CSI-RS-Resource*, *CSI-IM-Resource*).

### CSI-FrequencyOccupation information element

```
-- ASN1START
-- TAG-CSI-FREQUENCYOCCUPATION-START

CSI-FrequencyOccupation ::=
    SEQUENCE {
        startingRB          INTEGER (0..maxNrofPhysicalResourceBlocks-1),
        nrofRBs             INTEGER (24..maxNrofPhysicalResourceBlocksPlus1),
        ...
    }

-- TAG-CSI-FREQUENCYOCCUPATION-STOP
-- ASN1STOP
```

| CSI-FrequencyOccupation field descriptions                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nrofRBs</b><br>Number of PRBs across which this CSI resource spans. Only multiples of 4 are allowed. The smallest configurable number is the minimum of 24 and the width of the associated BWP. If the configured value is larger than the width of the corresponding BWP, the UE shall assume that the actual CSI-RS bandwidth is equal to the width of the BWP. |
| <b>startingRB</b><br>PRB where this CSI resource starts in relation to common resource block #0 (CRB#0) on the common resource block grid. Only multiples of 4 are allowed (0, 4, ...)                                                                                                                                                                               |

— CSI-IM-Resource

The IE *CSI-IM-Resource* is used to configure one CSI Interference Management (IM) resource.

CSI-IM-Resource information element

```
-- ASN1START
-- TAG-CSI-IM-RESOURCE-START

CSI-IM-Resource ::=
  csi-IM-ResourceId
  csi-IM-ResourceElementPattern
    pattern0
      subcarrierLocation-p0

| CSI-IM-Resource field descriptions   |                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-IM-ResourceElementPattern</b> | The resource element pattern (Pattern0 (2,2) or Pattern1 (4,1)) with corresponding parameters (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                  |
| <b>freqBand</b>                      | Frequency-occupancy of CSI-IM (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                                                  |
| <b>periodicityAndOffset</b>          | Periodicity and slot offset for periodic/semi-persistent CSI-IM. Network always configures the UE with a value for this field for periodic and semi-persistent CSI-IM-Resources (as indicated in CSI-ResourceConfig). A change of configuration between periodic or semi-persistent and aperiodic for a CSI-IM-Resource is not supported without a release and add. |
| <b>subcarrierLocation-p0</b>         | OFDM subcarrier occupancy of the CSI-IM resource for Pattern0 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                  |
| <b>subcarrierLocation-p1</b>         | OFDM subcarrier occupancy of the CSI-IM resource for Pattern1 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                  |
| <b>symbolLocation-p0</b>             | OFDM symbol location of the CSI-IM resource for Pattern0 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                       |
| <b>symbolLocation-p1</b>             | OFDM symbol location of the CSI-IM resource for Pattern1 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                       |

| Conditional Presence            | Explanation                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PeriodicOrSemiPersistent</i> | The field is optionally present, Need M, for periodic and semi-persistent CSI-IM-Resources (as indicated in CSI-ResourceConfig). The field is absent otherwise. |

— *CSI-IM-ResourceId*

The IE *CSI-IM-ResourceId* is used to identify one *CSI-IM-Resource*.

***CSI-IM-ResourceId* information element**

```
-- ASN1START
-- TAG-CSI-IM-RESOURCEID-START

CSI-IM-ResourceId ::=                INTEGER (0..maxNrofCSI-IM-Resources-1)

-- TAG-CSI-IM-RESOURCEID-STOP
-- ASN1STOP
```

— *CSI-IM-ResourceSet*

The IE *CSI-IM-ResourceSet* is used to configure a set of one or more CSI Interference Management (IM) resources (their IDs) and set-specific parameters.

***CSI-IM-ResourceSet* information element**

```
-- ASN1START
-- TAG-CSI-IM-RESOURCESET-START

CSI-IM-ResourceSet ::=
    csi-IM-ResourceSetId             SEQUENCE {
        csi-IM-Resources             CSI-IM-ResourceSetId,
        ...                          SEQUENCE (SIZE(1..maxNrofCSI-IM-ResourcesPerSet)) OF CSI-IM-ResourceId,
    }

-- TAG-CSI-IM-RESOURCESET-STOP
-- ASN1STOP
```

| <i>CSI-IM-ResourceSet</i> field descriptions                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>csi-IM-Resources</i></b><br><i>CSI-IM-Resources</i> associated with this <i>CSI-IM-ResourceSet</i> (see TS 38.214 [19], clause 5.2). |

— *CSI-IM-ResourceSetId*

The IE *CSI-IM-ResourceSetId* is used to identify *CSI-IM-ResourceSets*.

**CSI-IM-ResourceSetId information element**

```
-- ASN1START
-- TAG-CSI-IM-RESOURCESETID-START

CSI-IM-ResourceSetId ::=
    INTEGER (0..maxNrofCSI-IM-ResourceSets-1)

-- TAG-CSI-IM-RESOURCESETID-STOP
-- ASN1STOP
```

**CSI-MeasConfig**

The IE *CSI-MeasConfig* is used to configure CSI-RS (reference signals) belonging to the serving cell in which *CSI-MeasConfig* is included, channel state information reports to be transmitted on PUCCH on the serving cell in which *CSI-MeasConfig* is included and channel state information reports on PUSCH triggered by DCI received on the serving cell in which *CSI-MeasConfig* is included. See also TS 38.214 [19], clause 5.2.

**CSI-MeasConfig information element**

```
-- ASN1START

## – CSI-ReportConfig

The IE *CSI-ReportConfig* is used to configure a periodic or semi-persistent report sent on PUCCH on the cell in which the *CSI-ReportConfig* is included, or to configure a semi-persistent or aperiodic report sent on PUSCH triggered by DCI received on the cell in which the *CSI-ReportConfig* is included (in this case, the cell on which the report is sent is determined by the received DCI). See TS 38.214 [19], clause 5.2.1.

| <b>codebookConfig</b><br>Codebook configuration for Type-1 or Type-2 including codebook subset restriction. Network can only configure one of <i>codebookConfig</i> , <i>codebookConfig-r16</i> or <i>codebookConfig-r17</i> or <i>codebookConfig-r18</i> in a <i>CSI-ReportConfig</i> . The network includes <i>codebookConfig-v1730</i> only if <i>codebookConfig-r17</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>cqi-BitsPerSubband</b><br>This field can only be present if <i>cqi-FormatIndicator</i> is set to <i>subbandCQI</i> . If the field is configured with <i>bits4</i> , the UE uses 4-bit sub-band CQI. If the field is not present and <i>cqi-FormatIndicator</i> is set to <i>subbandCQI</i> , the UE uses 2-bit sub-band differential CQI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>cqi-FormatIndicator</b><br>Indicates whether the UE shall report a single (wideband) or multiple (subband) CQI (see TS 38.214 [19], clause 5.2.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>cqi-Table</b><br>Which CQI table to use for CQI calculation (see TS 38.214 [19], clause 5.2.2.1). For an (e)RedCap UE, CQI table 2 is only supported if the UE indicates support of 256QAM for PDSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>csi-IM-ResourcesForInterference</b><br>CSI IM resources for interference measurement. <i>csi-ResourceConfigId</i> of a <i>CSI-ResourceConfig</i> included in the configuration of the serving cell indicated with the field "carrier" above. The <i>CSI-ResourceConfig</i> indicated here contains only CSI-IM resources. The <i>bwp-Id</i> in that <i>CSI-ResourceConfig</i> is the same value as the <i>bwp-Id</i> in the <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> .                                                                                                                                                                                                                                                                                                                                         |
| <b>csi-ReportingBand</b><br>Indicates a contiguous or non-contiguous subset of subbands in the bandwidth part which CSI shall be reported for. Each bit in the bit-string represents one subband in order of frequency position in the BWP. The right-most bit in the bit string represents the lowest subband with the lowest frequency position in the BWP. The choice determines the number of subbands (subbands3 for 3 subbands, subbands4 for 4 subbands, and so on) (see TS 38.214 [19], clause 5.2.1.4). This field is absent if there are less than 24 PRBs (no sub band) and present otherwise (see TS 38.214 [19], clause 5.2.1.4).<br>NOTE: In TS 38.212 [17] clause 6.3.1.1.2 and TS 38.214 [19] clause 5.2.1.4, only subbands to be reported are numbered, e.g. subband #0 is the subband corresponding to the right-most bit set to 1. |
| <b>csi-ReportMode</b><br>Configures the CSI report modes Mode1 or Mode 2 (see TS 38.214 [19], clause 5.2.1.4.2)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>csi-ReportSubConfigToAddModList</b><br>List of CSI-ReportSubConfiguration(s) in a CSI report configuration to add or modify. No simultaneous configuration of <i>portSubsetIndicator</i> and a list of <i>nzp-CSI-RS-resources</i> in a same CSI report sub-configuration. The number of elements in a list is at least 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>csi-ReportSubConfigToReleaseList</b><br>List of CSI-ReportSubConfiguration(s) in a CSI report configuration to release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>dummy</b><br>This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>groupBasedBeamReporting</b><br>Turning on/off group beam based reporting (see TS 38.214 [19], clause 5.2.1.4). If <i>groupBasedBeamReporting</i> (without suffix) is set to disabled, <i>groupBasedBeamReporting-v1710</i> and <i>groupBasedBeamReporting-v1800</i> is absent. The network configures <i>groupBasedBeamReporting-v1800</i> only if <i>groupBasedBeamReporting-v1710</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| The CSI related quantities to report. see TS 38.214 [19], clause 5.2.1. If the field <i>reportQuantity-r16</i> , <i>reportQuantity-r17</i> or <i>reportQuantity-r18</i> is present, UE shall ignore <i>reportQuantity</i> (without suffix). Network does not configure <i>reportQuantity-r16</i> , <i>reportQuantity-r17</i> or <i>reportQuantity-r18</i> simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>reportingMode</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Configures the UE with reporting mode for group based reporting.(see TS 38.214 [19] clause 5.2.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>reportSlotConfig</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Periodicity and slot offset (see TS 38.214 [19], clause 5.2.1.4). If the field <i>reportSlotConfig-v1530</i> is present, the UE shall ignore the value provided in <i>reportSlotConfig</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**reportSlotOffsetList, reportSlotOffsetListDCI-0-1, reportSlotOffsetListDCI-0-2**

Timing offset Y for semi persistent reporting using PUSCH. This field lists the allowed offset values. This list must have the same number of entries as the *pusch-TimeDomainAllocationList* in *PUSCH-Config*. A particular value is indicated in DCI. The network indicates in the DCI field of the UL grant, which of the configured report slot offsets the UE shall apply. The DCI value 0 corresponds to the first report slot offset in this list, the DCI value 1 corresponds to the second report slot offset in this list, and so on. The first report is transmitted in slot  $n+Y$ , second report in  $n+Y+P$ , where P is the configured periodicity.

Timing offset Y for aperiodic reporting using PUSCH. This field lists the allowed offset values. This list must have the same number of entries as the *pusch-TimeDomainAllocationList* in *PUSCH-Config*. A particular value is indicated in DCI. The network indicates in the DCI field of the UL grant, which of the configured report slot offsets the UE shall apply. The DCI value 0 corresponds to the first report slot offset in this list, the DCI value 1 corresponds to the second report slot offset in this list, and so on (see TS 38.214 [19], clause 6.1.2.1).

The field *reportSlotOffsetListDCI-0-1* applies to DCI format 0\_1 and the field *reportSlotOffsetListDCI-0-2* applies to DCI format 0\_2 (see TS 38.214 [19], clause 6.1.2.1).

The fields *reportSlotOffsetList-r17*, *reportSlotOffsetListDCI-0-1-r17* and *reportSlotOffsetListDCI-0-2-r17* are only applicable for SCS 480 kHz and 960 kHz and if they are configured, the UE shall ignore the fields *reportSlotOffsetList* (without suffix), *reportSlotOffsetListDCI-0-1* (without suffix) and *reportSlotOffsetListDCI-0-2* (without suffix) for SCS 480 kHz and 960 kHz.

**resourcesForChannelMeasurement**

Resources for channel measurement. *csi-ResourceConfigId* of a *CSI-ResourceConfig* included in the configuration of the serving cell indicated with the field "carrier" above. The *CSI-ResourceConfig* indicated here contains only NZP-CSI-RS resources and/or SSB resources. This *CSI-ReportConfig* is associated with the DL BWP indicated by *bwp-Id* in that *CSI-ResourceConfig*.

**sharedCMR**

Enables sharing of channel measurement resources between different CSI measurement hypotheses when (1) *csi-ReportMode* is set to 'Mode1' and *numberOfSingleTRP-CSI-Mode1* is set to 1 or 2; or (2) *csi-ReportMode* is set to 'Mode2' (see TS 38.214 [19], clause 5.2.1.4.2).

**subbandSize**

Indicates one out of two possible BWP-dependent values for the subband size as indicated in TS 38.214 [19], table 5.2.1.4-2 . If *csi-ReportingBand* is absent, the UE shall ignore this field.

**timeRestrictionForChannelMeasurements**

Time domain measurement restriction for the channel (signal) measurements (see TS 38.214 [19], clause 5.2.1.1).

**timeRestrictionForInterferenceMeasurements**

Time domain measurement restriction for interference measurements (see TS 38.214 [19], clause 5.2.1.1).

| <b>CSI-ReportSubConfig field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>codebookSubConfig</b><br/>Applicable codebook parameters for the ports indicated by <i>portSubsetIndicator</i>. Applicable value ranges for codebook subset restriction, rank restriction, N1, N2, and Ng and twoTX-CodebookSubsetRestriction follow existing specification according to the <i>codebookConfig</i> configured within the <i>CSI-ReportConfig</i>, and apply for the number of ports determined by <i>portSubsetIndicator</i> (see TS 38.214 [19], clause 5.2.1.4.2). In this field, the network always sets the <i>codebookType</i> to <i>type1</i>. When <i>reportQuantity</i> is set to '<i>cri-RI-i1-CQI</i>', the parameter <i>type1SinglePanel-codebookSubsetRestriction-i2</i> is mandatory to be configured in the <i>codebookSubConfig</i> for each sub-configuration that includes <i>portSubsetIndicator</i>.</p> |
| <p><b>non-PMI-PortIndication</b><br/>Port indication for RI/CQI calculation applicable only for non-PMI feedback. The field shall be configured only if the <i>portSubsetIndicator-r18</i> is configured. For each CSI-RS resource in the linked <i>CSI-ResourceConfig</i> for channel measurement, a port indication for each rank R, indicating which R ports out of P ports to use within the sub-configuration. P corresponds to the number of bits with value 1 in the bitmap <i>portSubsetIndicator-r18</i>.</p>                                                                                                                                                                                                                                                                                                                            |
| <p><b>nzp-CSI-RS-ResourceList</b><br/>List of NZP CSI RS resources for the sub-configuration that is a (sub)set of NZP CSI-RS resource(s) of the CSI-RS resource set for channel measurement associated with the sub-configuration in the CSI report configuration. Value 0 refers to the first NZP CSI RS resource of the CSI-RS resource set, value 1 refers to the second NZP CSI RS resource of the CSI-RS resource set, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>portSubsetIndicator</b><br/>Indicates the (sub)set of CSI-RS antenna ports used for CSI calculation of the sub-configuration. In the bit string, each bit corresponds to an antenna port. When a bit is set to 1, the corresponding port is enabled for CSI calculation corresponding to the sub-configuration. When the bit is set to zero, the corresponding port is not enabled for CSI calculation corresponding to the sub-configuration. The size of the bit string equals P bits, where <math>P=2/4/8/12/16/24/32</math> represents the number of ports of the NZP CSI-RS resource(s) in the resource set for channel measurement associated with the <i>CSI-ReportConfig</i>.</p>                                                                                                                                                   |
| <p><b>powerOffset</b><br/>When <i>powerControlOffset</i> is configured in NZP CSI-RS resources in the resource set for channel measurement associated with the <i>CSI-ReportConfig</i>, the power offset of PDSCH EPRE to NZP CSI-RS EPRE is equal to <i>powerControlOffset</i> - <i>powerOffset</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>reportSubConfigParams</b><br/>Indicates the parameters to be used for the CSI report sub-configuration, which includes either <i>a1-parameters</i> that contain the antenna port subset and the associated parameters relevant to the sub-configuration or <i>a2-parameters</i> that contain the list of NZP CSI-RS resources for the sub-configuration (see TS 38.214 [19], clause 5.2.1.4.2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>TDCP field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>delayDSetofLengthY</b><br/>Configures a set of Y delay values for TDCP reporting, see reference TS 38.214 clause 5.2.1.4. The <i>symb4</i> denotes 4 symbols, the <i>slot1</i> denotes 1 slot, the <i>slot2</i> denotes 2 slots and so on. The value <i>slot10</i> is applicable only to SCS <math>\geq 30</math>kHz. The parameter Y, see reference TS38.214 clause 5.2.1.4, is given by the length of the set of D values.</p> |
| <p><b>phaseReporting</b><br/>Configures the UE for phase reporting for TDCP reporting see reference TS 38.214 clause 5.2.1.4</p>                                                                                                                                                                                                                                                                                                       |

### — *CSI-ReportConfigId*

The IE *CSI-ReportConfigId* is used to identify one *CSI-ReportConfig*.

#### ***CSI-ReportConfigId* information element**

```
-- ASN1START
-- TAG-CSI-REPORTCONFIGID-START

CSI-ReportConfigId ::=                INTEGER (0..maxNrofCSI-ReportConfigurations-1)

-- TAG-CSI-REPORTCONFIGID-STOP
-- ASN1STOP
```

### — *CSI-ReportPeriodicityAndOffset*

The IE *CSI-ReportPeriodicityAndOffset* is used to configure a periodicity and a corresponding offset. Both the periodicity and the offset are given in number of slots. The periodicity value *slots4* corresponds to 4 slots, value *slots5* corresponds to 5 slots, and so on.

#### ***CSI-ReportPeriodicityAndOffset* information element**

```
-- ASN1START
-- TAG-CSI-REPORTPERIODICITYANDOFFSET-START

CSI-ReportPeriodicityAndOffset ::= CHOICE {
    slots4                INTEGER(0..3),
    slots5                INTEGER(0..4),
    slots8                INTEGER(0..7),
    slots10               INTEGER(0..9),
    slots16               INTEGER(0..15),
    slots20               INTEGER(0..19),
    slots40               INTEGER(0..39),
    slots80               INTEGER(0..79),
    slots160              INTEGER(0..159),
    slots320              INTEGER(0..319)
}

-- TAG-CSI-REPORTPERIODICITYANDOFFSET-STOP
-- ASN1STOP
```

### — *CSI-ReportSubConfigId*

The IE *CSI-ReportSubConfigId* is used to indicate the index of one *CSI-ReportSubConfig* within a CSI report configuration.

***CSI-ReportSubConfigId* information element**

```

-- ASN1START
-- TAG-CSI-REPORTSUBCONFIGID-START

CSI-ReportSubConfigId-r18 ::= INTEGER (0..maxNrofCSI-ReportSubconfigPerCSI-ReportConfig-1-r18)

-- TAG-CSI-REPORTSUBCONFIGID-STOP
-- ASN1STOP

```

— ***CSI-ReportSubConfigTriggerList***

The IE *CSI-ReportSubConfigTriggerList* is used to configure a list of sub-configuration ID(s) of N sub-configurations out of L configured sub-configurations within a CSI-ReportConfig associated with a triggering state for semi-persistent CSI reporting on PUSCH and aperiodic CSI reporting.

***CSI-ReportSubConfigTriggerList* information element**

```

-- ASN1START
-- TAG-CSI-REPORTSUBCONFIGTRIGGERLIST-START

CSI-ReportSubConfigTriggerList-r18 ::= SEQUENCE (SIZE(1..maxNrofCSI-ReportSubconfigPerCSI-ReportConfig-r18)) OF CSI-ReportSubConfigId-r18

-- TAG-CSI-REPORTSUBCONFIGTRIGGERLIST-STOP
-- ASN1STOP

```

— ***CSI-ResourceConfig***

The IE *CSI-ResourceConfig* defines a group of one or more *NZP-CSI-RS-ResourceSet*, *CSI-IM-ResourceSet* and/or *CSI-SSB-ResourceSet*.

***CSI-ResourceConfig* information element**

```

-- ASN1START
-- TAG-CSI-RESOURCECONFIG-START

CSI-ResourceConfig ::= SEQUENCE {
  csi-ResourceConfigId      CSI-ResourceConfigId,
  csi-RS-ResourceSetList    CHOICE {
    nzp-CSI-RS-SSB          SEQUENCE {
      nzp-CSI-RS-ResourceSetList SEQUENCE (SIZE (1..maxNrofNZP-CSI-RS-ResourceSetsPerConfig)) OF NZP-CSI-RS-ResourceSetId
                                                                    OPTIONAL, -- Need R
    },
    csi-SSB-ResourceSetList  SEQUENCE (SIZE (1..maxNrofCSI-SSB-ResourceSetsPerConfig)) OF CSI-SSB-ResourceSetId OPTIONAL -- Need R
  },
  csi-IM-ResourceSetList    SEQUENCE (SIZE (1..maxNrofCSI-IM-ResourceSetsPerConfig)) OF CSI-IM-ResourceSetId
},

It does not apply to resources provided in the <i>csi-SSB-ResourceSetList</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

– CSI-ResourceConfigId

The IE *CSI-ResourceConfigId* is used to identify a *CSI-ResourceConfig*.

CSI-ResourceConfigId information element

```

-- ASN1START
-- TAG-CSI-RESOURCECONFIGID-START

```

CSI-ResourceConfigId ::= INTEGER (0..maxNrofCSI-ResourceConfigurations-1)

```
-- TAG-CSI-RESOURCECONFIGID-STOP
-- ASN1STOP
```

## — *CSI-ResourcePeriodicityAndOffset*

The IE *CSI-ResourcePeriodicityAndOffset* is used to configure a periodicity and a corresponding offset for periodic and semi-persistent CSI resources, and for periodic and semi-persistent reporting on PUCCH. both, the periodicity and the offset are given in number of slots. The periodicity value *slots4* corresponds to 4 slots, value *slots5* corresponds to 5 slots, and so on.

### *CSI-ResourcePeriodicityAndOffset* information element

```
-- ASN1START
-- TAG-CSI-RESOURCEPERIODICITYANDOFFSET-START

CSI-ResourcePeriodicityAndOffset ::= CHOICE {
    slots4      INTEGER (0..3),
    slots5      INTEGER (0..4),
    slots8      INTEGER (0..7),

| <b>sequenceGenerationConfig</b><br>Scrambling ID for CSI-RS (see TS 38.211 [16], clause 7.4.1.5.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>slotConfig</b><br>Indicates the CSI-RS periodicity (in milliseconds) and for each periodicity the offset (in number of slots). When <i>subcarrierSpacing</i> is set to <i>kHz15</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 3/4/9/19/39 slots. When <i>subcarrierSpacing</i> is set to <i>kHz30</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 7/9/19/39/79 slots. When <i>subcarrierSpacing</i> is set to <i>kHz60</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 15/19/39/79/159 slots. When <i>subcarrierSpacing</i> is set to <i>kHz120</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 31/39/79/159/319 slots. When <i>subcarrierSpacing</i> is set to <i>kHz480</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 127/159/319/639/1279 slots. When <i>subcarrierSpacing</i> is set to <i>kHz960</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 255/319/639/1279/2559 slots. If <i>slotConfig-r17</i> is present, UE shall ignore the <i>slotConfig</i> (without suffix). |

## – CSI-RS-ResourceMapping

The IE *CSI-RS-ResourceMapping* is used to configure the resource element mapping of a CSI-RS resource in time- and frequency domain.

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>servingAdditionalPCIList</b></p> <p>Indicates the physical cell IDs (PCI) of the SSBs in the <i>csi-SSB-ResourceList</i>. If present, the list has the same number of entries as <i>csi-SSB-ResourceList</i>. The first entry of the list indicates the value of the PCI for the first entry of <i>csi-SSB-ResourceList</i>, the second entry of this list indicates the value of the PCI for the second entry of <i>csi-SSB-ResourceList</i>, and so on. For each entry, the following applies:</p> <ul style="list-style-type: none"><li>- If the value is zero, the PCI is the PCI of the serving cell in which this <i>CSI-SSB-ResourceSet</i> is defined;</li><li>- otherwise, the value is <i>additionalPCIIndex-r17</i> of an <i>SSB-MTC-AdditionalPCI-r17</i> configured using the <i>additionalPCI-ToAddModList-r17</i> in <i>ServingCellConfig</i>, and the PCI is the <i>additionalPCI-r17</i> in this <i>SSB-MTC-AdditionalPCI-r17</i>.</li></ul> |

— *CSI-SSB-ResourceSetId*

The IE *CSI-SSB-ResourceSetId* is used to identify one SS/PBCH block resource set.

**CSI-SSB-ResourceId information element**

```
-- ASN1START
-- TAG-CSI-SSB-RESOURCESETID-START

CSI-SSB-ResourceSetId ::=          INTEGER (0..maxNrofCSI-SSB-ResourceSets-1)

-- TAG-CSI-SSB-RESOURCESETID-STOP
-- ASN1STOP
```

— *DedicatedNAS-Message*

The IE *DedicatedNAS-Message* is used to transfer UE specific NAS layer information between the 5GC CN and the UE. The RRC layer is transparent for this information.

**DedicatedNAS-Message information element**

```
-- ASN1START
-- TAG-DEDICATED-NAS-MESSAGE-START

DedicatedNAS-Message ::=          OCTET STRING

-- TAG-DEDICATED-NAS-MESSAGE-STOP
-- ASN1STOP
```

## — *DL-PPW-PreConfig*

The IE *DL-PPW-PreConfig* provides configuration for a measurement window where a UE is expected to measure the DL PRS, if it is inside the active DL BWP and with the same numerology as the active DL BWP. Based upon the indication received in the configuration, the UE identifies whether the DL PRS priority is higher than that of the other DL signals or channels and accordingly determines, for example, the UE is expected to measure the DL PRS and is not expected to receive other DL signals and channels.

### *DL-PPW-PreConfig* information element

```
-- ASN1START
-- TAG-DL-PPW-PRECONFIG-START

DL-PPW-PreConfig-r17 ::= SEQUENCE {
    dl-PPW-ID-r17                DL-PPW-ID-r17,

| <p><b><i>pusch-DMRS-Bundling</i></b><br/>Indicates whether DMRS bundling and time domain window for PUSCH are jointly enabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>pusch-FrequencyHoppingInterval</i></b><br/>Configures the number of consecutive slots for the UE to perform inter-slot frequency hopping with inter-slot bundling for PUSCH. When both inter-frequency hopping and DMRS bundling are enabled for PUSCH repetitions, the UE is expected to be configured with at least one <i>pusch-FrequencyHoppingInterval-r17</i> and <i>pusch-TimeDomainWindowLength-r17</i>. This parameter is shared for both DG-PUSCH and CG-PUSCH. When DMRS bundling for PUSCH is enabled by <i>pusch-DMRS-Bundling-r17</i>, PUSCH frequency hopping interval is only determined by the configuration of PUSCH hopping interval if PUSCH hopping interval is configured. If the field is absent, the number of consecutive slots for the UE to perform inter-slot PUSCH frequency hopping is indicated by <i>pusch-TimeDomainWindowLength-r17</i>.<br/>Note: For unpaired spectrum, the UE is not expected to be configured the value of s6, s8, s12, s14 and s16.</p> |
| <p><b><i>pusch-TimeDomainWindowLength</i></b><br/>Configures the length of a nominal time domain window in number of consecutive slots for DMRS bundling for PUSCH. The value shall not exceed the maximum duration for DMRS bundling for PUSCH as specified in TS 38.306 [26]. For PUSCH repetition type A/B, if this field is absent, the UE shall apply the default value that is the minimum value in the unit of consecutive slots of the time duration for the transmission of all PUSCH repetitions and the maximum duration for DMRS bundling for PUSCH as specified in TS 38.306 [26]. For TBoMS, if this field is absent, the UE shall apply the default value that is the minimum value in the unit of consecutive slots of the duration of TBoMS transmission (including repetition of TBoMS) and the maximum duration for DMRS bundling for PUSCH as specified in TS 38.306 [26].</p>                                                                                                      |
| <p><b><i>pusch-WindowRestart</i></b><br/>Indicates whether UE bundles PUSCH DMRS remaining in a nominal time domain window after event(s) triggered by DCI or MAC CE that violate power consistency and phase continuity requirements is enabled (see TS 38.214 [19], clause 6.1.7).<br/>NOTE: Events, which are triggered by DCI or MAC CE, but do not require UE capability to resume maintaining power consistency and/or phase continuity as specified in clause 6.1.7 of TS 38.214 [19], are excluded.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>DMRS-DownlinkConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dmrs-AdditionalPosition</b>                | Position for additional DM-RS in DL, see Tables 7.4.1.1.2-3 and 7.4.1.1.2-4 in TS 38.211 [16]. If the field is absent, the UE applies the value pos2. See also clause 7.4.1.1.2 for additional constraints on how the network may set this field depending on the setting of other fields.                                                  |
| <b>dmrs-Downlink</b>                          | This field indicates whether low PAPR DMRS is used, as specified in TS38.211 [16], clause 7.4.1.1.1.                                                                                                                                                                                                                                        |
| <b>dmrs-Type</b>                              | Selection of the DMRS type to be used for DL (see TS 38.211 [16], clause 7.4.1.1.1). If the field is absent, the UE uses DMRS type 1.                                                                                                                                                                                                       |
| <b>dmrs-TypeEnh</b>                           | This field is used in TS 38.211 [16], clause 7.4.1.1.2.                                                                                                                                                                                                                                                                                     |
| <b>maxLength</b>                              | The maximum number of OFDM symbols for DL front loaded DMRS. <i>len1</i> corresponds to value 1. <i>len2</i> corresponds to value 2. If the field is absent, the UE applies value <i>len1</i> . If set to <i>len2</i> , the UE determines the actual number of DM-RS symbols by the associated DCI. (see TS 38.211 [16], clause 7.4.1.1.2). |
| <b>phaseTrackingRS</b>                        | Configures downlink PTRS. If the field is not configured, the UE assumes that downlink PTRS are absent. See TS 38.214 [19] clause 5.1.6.3.                                                                                                                                                                                                  |
| <b>scramblingID0</b>                          | DL DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.1.1). When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell.                                                                                                                                                             |
| <b>scramblingID1</b>                          | DL DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.1.1). When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell.                                                                                                                                                             |

## – DMRS-UplinkConfig

| <b>dmrs-AdditionalPosition</b><br>Position for additional DM-RS in UL (see TS 38.211 [16], clause 6.4.1.1.3). If the field is absent, the UE applies the value pos2. See also clause 6.4.1.1.3 for additional constraints on how the network may set this field depending on the setting of other fields.                                                                                                                                                                                                         |
| <b>dmrs-Type</b><br>Selection of the DMRS type to be used for UL (see TS 38.211 [16], clause 6.4.1.1.3) If the field is absent, the UE uses DMRS type 1.                                                                                                                                                                                                                                                                                                                                                          |
| <b>dmrs-TypeEnh</b><br>This field is used in TS 38.211 [16], clause 6.4.1.1.3.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>dmrs-Uplink</b><br>This field indicates whether low PAPR DMRS is used, as specified in TS38.211 [16], clause 6.4.1.1.1.1.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>dmrs-UplinkTransformPrecoding</b><br>This field indicates whether low PAPR DMRS is used for PUSCH with $\pi/2$ BPSK modulation, as specified in TS38.211 [16], clause 6.4.1.1.1.2. The network configures this field only if <i>tp-<math>\pi/2</math>BPSK</i> is configured in <i>PUSCH-Config</i> .                                                                                                                                                                                                           |
| <b>maxLength</b><br>The maximum number of OFDM symbols for UL front loaded DMRS. <i>len1</i> corresponds to value 1. <i>len2</i> corresponds to value 2. If the field is absent, the UE applies value <i>len1</i> . If set to <i>len2</i> , the UE determines the actual number of DM-RS symbols by the associated DCI. (see TS 38.211 [16], clause 6.4.1.1.3).                                                                                                                                                   |
| <b>nPUSCH-Identity</b><br>Parameter: $N_{ID}^{(PUSCH)}$ for DFT-s-OFDM DMRS. If the value is absent or released, the UE uses the value Physical cell ID ( <i>physCellId</i> ). See TS 38.211 [16].                                                                                                                                                                                                                                                                                                                |
| <b>phaseTrackingRS</b><br>Configures uplink PTRS (see TS 38.211 [16]).                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><math>\pi/2</math>BPSK-ScramblingID0, <math>\pi/2</math>BPSK-ScramblingID1</b><br>UL DMRS scrambling initialization for $\pi/2$ BPSK DMRS for PUSCH (see TS 38.211 [16], Clause 6.4.1.1.2). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ) of the serving cell.                                                                                                                                                                                                      |
| <b>scramblingID0</b><br>UL DMRS scrambling initialization for CP-OFDM (see TS 38.211 [16], clause 6.4.1.1.1.1). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ).                                                                                                                                                                                                                                                                                                         |
| <b>scramblingID1</b><br>UL DMRS scrambling initialization for CP-OFDM. (see TS 38.211 [16], clause 6.4.1.1.1.1). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ).                                                                                                                                                                                                                                                                                                        |
| <b>sequenceGroupHopping</b><br>For DMRS transmission with transform precoder the NW may configure group hopping by the cell-specific parameter <i>groupHoppingEnabledTransformPrecoding</i> in <i>PUSCH-ConfigCommon</i> . In this case, the NW may include this UE specific field to disable group hopping for PUSCH transmission except for Msg3, i.e., to override the configuration in <i>PUSCH-ConfigCommon</i> (see TS 38.211 [16]). If the field is absent, the UE uses the same hopping mode as for Msg3. |
| <b>sequenceHopping</b><br>Determines if sequence hopping is enabled for DMRS transmission with transform precoder for PUSCH transmission other than Msg3 (sequence hopping is always disabled for Msg3). If the field is absent, the UE uses the same hopping mode as for msg3. The network does not configure simultaneous group hopping and sequence hopping. See TS 38.211 [16], clause 6.4.1.1.1.2.                                                                                                           |
| <b>transformPrecodingDisabled</b><br>DMRS related parameters for Cyclic Prefix OFDM.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>transformPrecodingEnabled</b><br>DMRS related parameters for DFT-s-OFDM (Transform Precoding).                                                                                                                                                                                                                                                                                                                                                                                                                 |

## – DownlinkConfigCommon

The IE *DownlinkConfigCommon* provides common downlink parameters of a cell.

DownlinkConfigCommon information element

```

-- ASN1START
-- TAG-DOWNLINKCONFIGCOMMON-START

DownlinkConfigCommon ::= SEQUENCE {
    frequencyInfoDL          FrequencyInfoDL          OPTIONAL, -- Cond InterFreqH0AndServCellAdd
    initialDownlinkBWP       BWP-DownlinkCommon        OPTIONAL, -- Cond ServCellAdd
    ...
    [[
        initialDownlinkBWP-RedCap-r17 BWP-DownlinkCommon OPTIONAL -- Need R
    ]]
}

-- TAG-DOWNLINKCONFIGCOMMON-STOP
-- ASN1STOP

```

| DownlinkConfigCommon field descriptions                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>frequencyInfoDL</b><br>Basic parameters of a downlink carrier and transmission thereon.                                                                                                                                                                                      |
| <b>initialDownlinkBWP</b><br>The initial downlink BWP configuration for a serving cell. The network configures the <i>locationAndBandwidth</i> so that the initial downlink BWP contains the entire CORESET#0 of this serving cell in the frequency domain.                     |
| <b>initialDownlinkBWP-RedCap</b><br>If present, (e)RedCap UEs use this DL BWP instead of <i>initialDownlinkBWP</i> .<br>If absent, (e)RedCap UEs use <i>initialDownlinkBWP</i> provided that it does not exceed the (e)RedCap UE maximum bandwidth (see also clause 5.2.2.4.2). |

| Conditional Presence             | Explanation                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>InterFreqH0AndServCellAdd</i> | This field is mandatory present for inter-frequency handover, and upon serving cell (PSCell/SCell) addition. Otherwise, the field is optionally present, Need M.   |
| <i>ServCellAdd</i>               | This field is mandatory present upon serving cell addition (for PSCell and SCell) and upon handover from E-UTRA to NR. It is optionally present, Need M otherwise. |

DownlinkConfigCommonSIB

The IE *DownlinkConfigCommonSIB* provides common downlink parameters of a cell.

| <b><i>frequencyInfoDL-SIB</i></b><br>Basic parameters of a downlink carrier and transmission thereon.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>initialDownlinkBWP</i></b><br>The initial downlink BWP configuration for a PCell. The network configures the <i>locationAndBandwidth</i> so that the initial downlink BWP contains the entire CORESET#0 of this serving cell in the frequency domain. The UE applies the <i>locationAndBandwidth</i> upon reception of this field (e.g. to determine the frequency position of signals described in relation to this <i>locationAndBandwidth</i> ) but it keeps CORESET#0 until after reception of <i>RRCSetup/RRCResume/RRCReestablishment</i> .                                                                                                                                                                                                                                                                                                                                   |
| <b><i>initialDownlinkBWP-RedCap</i></b><br>If present, (e)RedCap UEs use this DL BWP instead of <i>initialDownlinkBWP</i> . If the <i>locationAndBandwidth</i> of this BWP contains the entire CORESET#0, the UE applies the <i>locationAndBandwidth</i> upon reception of this field (e.g. to determine the frequency position of signals described in relation to this <i>locationAndBandwidth</i> ) but it keeps CORESET#0 until after reception of <i>RRCSetup/RRCResume/RRCReestablishment</i> . Otherwise, i.e., if the <i>locationAndBandwidth</i> of this BWP does not contain the entire CORESET#0, the UE uses this BWP for receiving DL messages during initial access (Msg2, MsgB, Msg4) and after initial access.<br>If absent, (e)RedCap UEs use <i>initialDownlinkBWP</i> provided that it does not exceed the (e)RedCap UE maximum bandwidth (see also clause 5.2.2.4.2). |
| <b><i>lastUsedCellOnly</i></b><br>When present, the field indicates that the UE monitors PEI only if the latest received <i>RRCRelease</i> without <i>noLastCellUpdate</i> is from this cell. A PEI-capable UE stores its last used cell information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>pcch-Config</i></b><br>The paging related configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <p><b>payloadSizeDCI-2-7</b><br/>Payload size of PEI DCI, i.e., DCI format 2_7. The size is no larger than the payload size of paging DCI which has maximum of 41 bits and 43 bits for licensed and unlicensed spectrums, respectively.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>pei-FrameOffset</b><br/>Offset, in number of frames from the start of a reference frame for PEI-O to the start of a first paging frame of the paging frames associated with the PEI-O, see TS 38.213 [13], clause 10.4A.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>po-NumPerPEI</b><br/>The number of PO(s) associated with one PEI monitoring occasion. It is a factor of the total PO number in a paging cycle, i.e <math>N \times N_s</math>, as specified in TS 38.304 [20]. The maximum number of PF associated with one PEI monitoring occasion is 2. The number of PO mapping to one PEI should be multiple of <math>N_s</math> when <math>\text{po-NumPerPEI}</math> is larger than <math>N_s</math>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| SubgroupConfig field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>subgroupsNumPerPO</b><br>Total number of subgroups per Paging Occasion (PO) for UE to read subgroups indication from physical-layer signaling. The field represents the sum of CN-assigned and UEID-based subgroups supported by the network. When <i>PEI-Config</i> is configured, there is always at least one subgroup (UEID-based subgroup or CN-assigned subgroup) configured.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>subgroupsNumForUEID</b><br>Number of subgroups per Paging Occasion (PO) for UE to read subgroups indication from physical-layer signaling, for UEID-based subgrouping method. When present, the field is set to an integer smaller than or equal to <i>subgroupsNumPerPO</i> . <i>subgroupsNumPerPO</i> equals to <i>subgroupsNumForUEID</i> when the network does not configure CN-assigned subgrouping. When <i>pei-Config</i> is configured, the field is absent when the network only configures CN-assigned subgrouping. Both this field and <i>subgroupsNumPerPO</i> are equal to 1 when the network does not configure subgrouping. When <i>pei-Config</i> is configured, if the field is absent, the UE uses subgrouping according to TS 38.304 [20], clause 7.3.0. |

| Conditional Presence   | Explanation                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>SharedSpectrum2</i> | The field is optional present, Need R, if this cell operates with shared spectrum channel access. Otherwise, it is absent, Need R. |

– DownlinkPreemption

The IE *DownlinkPreemption* is used to configure the UE to monitor PDCCH for the INT-RNTI (interruption).

EarlyUL-SyncConfig field descriptions

frequencyInfoUL

This field provides basic parameters of an uplink carrier for PRACH transmission on a candidate cell.

ltm-PRACH-SubcarrierSpacing

Indicates subcarrier spacing of PRACH for LTM (see TS 38.211 [16], clause 5.3.2).

Only the following values are applicable depending on the used frequency:

FR1: 15 or 30 kHz

FR2-1: 60 or 120 kHz

FR2-2: 120, 480, or 960 kHz

If absent, the UE applies the SCS as derived from the prach-ConfigurationIndex in RACH-ConfigGeneric (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]).

n-TimingAdvanceOffset

The N\_TA-Offset to be applied for all uplink transmissions on a candidate cell. If the field is absent, the UE applies the value as defined in TS 38.133 [14], table 7.1.2-2.

rach-ConfigGeneric

RACH parameters for performing a random access procedure on a candidate cell.

ssb-PerRACH-Occasion

This field indicated the number of SSBs for RACH occasion.

| Conditional Presence | Explanation                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| L139                 | The field is mandatory present if prach-RootSequenceIndex L=139, otherwise the field is absent, Need S. |
| TDD                  | This field is optionally present, Need R, for TDD LTM candidate cells. It is absent otherwise.          |

– EphemerisInfo

The IE EphemerisInfo provides satellite ephemeris. Ephemeris may be expressed either in format of position and velocity state vector in ECEF or in format of orbital parameters in ECI. Note: The ECI and ECEF coincide at epochTime, i.e., x,y,z axis in ECEF are aligned with x,y,z axis in ECI at epochTime.

EphemerisInfo information element

```
-- ASN1START
-- TAG-EPHEMERISINFO-START

EphemerisInfo-r17 ::= CHOICE {

## — *EpochTime*

The IE *EpochTime* is used to indicate the epoch time for the NTN assistance information, and it is defined as the starting time of a DL sub-frame, indicated by a SFN and a sub-frame number signaled together with the assistance information. The reference point for *EpochTime* of the serving or neighbour NTN payload ephemeris and Common TA parameters is the uplink time synchronization reference point of the serving cell when this field is provided in an NTN cell and the gNB when this field is provided in a TN cell. In case of handover or conditional handover, the reference point for *EpochTime* of the target NTN payload ephemeris and Common TA parameters is the uplink time synchronization reference point of the target cell. In case of handover or conditional handover, *EpochTime* is based on the timing of the target cell, i.e. the SFN and sub-frame number indicated refers to the SFN and sub-frame of the target cell. Otherwise, *EpochTime* is used based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated refers to the SFN and sub-frame of the serving cell.

### *EpochTime* information element

```
-- ASN1START
-- TAG-EPOCHTIME-START

EpochTime-r17 ::=
    sfN-r17          SEQUENCE {
                      INTEGER(0..1023),
                      subFrameNR-r17  INTEGER(0..9)
    }

-- TAG-EPOCHTIME-STOP
-- ASN1STOP
```

### *EpochTime* field descriptions

#### *sfN*

For serving cell, it indicates the current SFN or the next upcoming SFN after the frame where the message indicating the *epochTime* is received. For neighbour or target cell when explicit epoch time is present, it indicates the SFN nearest to the frame where the message indicating the *epochTime* is received.

## — *EUTRA-C-RNTI*

The IE *EUTRA-C-RNTI* identifies a UE having a RRC connection within an E-UTRA cell.

### *EUTRA-C-RNTI* information element

```
-- ASN1START
-- TAG-EUTRACRNTI-START

EUTRA-C-RNTI ::=
    BIT STRING (SIZE (16))

-- TAG-EUTRACRNTI-STOP
-- ASN1STOP
```

— *FeatureCombination*

The IE *FeatureCombination* indicates a feature or a combination of features to be associated with a set of Random Access resources (i.e. an instance of *FeatureCombinationPreambles*).

***FeatureCombination* information element**

```
-- ASN1START
-- TAG-FEATURECOMBINATION-START

## – *FeatureCombinationPreambles*

The IE *FeatureCombinationPreambles* associates a set of preambles with a feature combination. For parameters which can be provided in this IE, the UE applies this field value when performing Random Access using a preamble in this featureCombinationPreambles, otherwise the UE applies the corresponding value as determined by applicable Need Code, e.g. Need S. On a specific BWP, there can be at most one set of preambles associated with a given feature combination per RA Type (i.e. 4-step RACH or 2-step RACH) per MSG1 repetition number.

| <p><b><i>absoluteFrequencyPointA</i></b><br/> Absolute frequency position of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b><i>absoluteFrequencySSB</i></b><br/> Frequency of the SSB to be used for this serving cell. SSB related parameters (e.g. SSB index) provided for a serving cell refer to this SSB frequency unless mentioned otherwise. The CD-SSB of the PCell is always on the sync raster. Frequencies are considered to be on the sync raster if they are also identifiable with a GSCN value (see TS 38.101-1 [15] or TS 38.101-5 [75]). If the field is absent, the SSB related parameters should be absent, e.g. <i>ssb-PositionsInBurst</i>, <i>ssb-periodicityServingCell</i> and <i>subcarrierSpacing</i> in <i>ServingCellConfigCommon</i> IE. If the field is absent, the UE obtains timing reference from the intra-band SpCell or intra-band SCell if applicable as described in TS 38.213 [13], clause 4.1, or from the SpCell or an SCell indicated by <i>referenceCell</i>, or from the reference serving cell defined in TS 38.133 [14]. This is supported in case the SCell for which the UE obtains the timing reference is in the same or different frequency band as the cell (i.e. the SpCell or the SCell, respectively) from which the UE obtains the timing reference.<br/> For PCell, this field corresponds to the CD-SSB.</p> |
| <p><b><i>frequencyBandList</i></b><br/> List containing only one frequency band to which this carrier(s) belongs. Multiple values are not supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b><i>referenceCell</i></b><br/> Indicates the reference cell, i.e. the cell which provides the timing reference and AGC source for the inter-band SSB-less SCell. If the reference cell is an SCell or PSCell, it should be an activated SCell or activated PSCell.<br/> If this field is absent for an inter-band SSB-less SCell, the reference serving cell is defined in TS 38.133 [14].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>scs-SpecificCarrierList</i></b><br/> A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A. The network configures a <i>scs-SpecificCarrier</i> at least for each numerology (SCS) that is used e.g. in a BWP (see TS 38.211 [16], clause 5.3).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Conditional Presence | Explanation                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SpCellAdd</i>     | The field is mandatory present if this <i>FrequencyInfoDL</i> is for SpCell. Otherwise the field is optionally present, Need S.                                                  |
| <i>SSBlessSCell</i>  | The field is optionally present, Need S, if the inter-band SSB-less SCell is configured for this cell and <i>absoluteFrequencySSB</i> is absent. It is absent otherwise, Need R. |

## – *FrequencyInfoDL-SIB*

The IE *FrequencyInfoDL-SIB* provides basic parameters of a downlink carrier and transmission thereon.

| <b>FrequencyInfoUL field descriptions</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absoluteFrequencyPointA</i></b>          | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>additionalSpectrumEmission</i></b>       | The additional spectrum emission requirements to be applied by the UE on this uplink. If both <i>additionalSpectrumEmission</i> (without suffix) and <i>additionalSpectrumEmission-v1760</i> are absent, the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15], tables 6.2.3.1-1A, 6.2A.3.1.1-2 and 6.2A.3.1.2-2, TS 38.101-2 [39], tables 6.2.3.1-2 and 6.2A.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). Network configures the same value in <i>additionalSpectrumEmission</i> for all uplink carrier(s) of the same band with UL configured and if signalled, the same value in <i>additionalSpectrumEmission-v1760</i> for all uplink carrier(s) of the same band with UL configured, except for <i>additionalSpectrumEmission</i> value corresponding to NS_55/NS_57. If NS_55/NS_57 (see TS 38.101-1 [15], table 6.2.3.1-1) is applicable for at least one uplink carrier, the network may configure either NS_55/NS_57 or NS_01 for these uplink carriers, and NS_01 for the remaining uplink carrier(s) of band n77. The <i>additionalSpectrumEmission</i> is applicable for all uplink carriers of the same band with UL configured. |
| <b><i>additionalSpectrumEmissionAerial</i></b> | The additional spectrum emission requirements to be applied by the aerial UE on this uplink (see TS 38.101-1 [15], clause 6.2K). If the field is absent, the aerial UE uses value indicated by the field <i>additionalSpectrumEmission/ additionalSpectrumEmission-v1760</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>frequencyBandList</i></b>                | List containing only one frequency band to which this carrier(s) belongs. Multiple values are not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>frequencyShift7p5khz</i></b>             | Enable the NR UL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>p-Max</i></b>                            | Maximum transmit power allowed in this serving cell. The maximum transmit power that the UE may use on this serving cell may be additionally limited by <i>p-NR-FR1</i> (configured for the cell group) and by <i>p-UE-FR1</i> (configured total for all serving cells operating on FR1). If absent, the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if <i>p-Max</i> is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. Value in dBm. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emission requirements as specified in TS 38.106 [79].                                                                                                                                                                                             |
| <b><i>scs-SpecificCarrierList</i></b>          | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A. The network configures a <i>scs-SpecificCarrier</i> at least for each numerology (SCS) that is used e.g. in a BWP (see TS 38.211 [16], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Conditional Presence</b>     | <b>Explanation</b>                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD-OrSUL-OrEarlyUL-Sync</i> | The field is mandatory present if this <i>FrequencyInfoUL</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL</i> ), if this <i>FrequencyInfoUL</i> is for a supplementary uplink (SUL), or if this <i>FrequencyInfoUL</i> is configured within <i>EarlyUL-SyncConfig</i> . It is absent, Need R, otherwise.                                                                                                 |
| <i>FDD-TDD-OrSUL-Optional</i>   | The field is optionally present, Need R, if this <i>FrequencyInfoUL</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL</i> ), or if this <i>FrequencyInfoUL</i> is for an unpaired UL (TDD) in certain bands (as defined in clause 5.4.2.1 of TS 38.101-1 and in clause 5.4.2.1 of TS 38.104 [12]), or if this <i>FrequencyInfoUL</i> is for a supplementary uplink (SUL). It is absent, Need R, otherwise. |

## – *FrequencyInfoUL-SIB*

The IE *FrequencyInfoUL-SIB* provides basic parameters of an uplink carrier and transmission thereon.

**FrequencyInfoUL-SIB information element**

```

-- ASN1START
-- TAG-FREQUENCYINFOUL-SIB-START

FrequencyInfoUL-SIB ::=
    frequencyBandList          SEQUENCE {
        absoluteFrequencyPointA MultiFrequencyBandListNR-SIB          OPTIONAL, -- Cond FDD-OrSUL

```

**FrequencyInfoUL-SIB field descriptions*****absoluteFrequencyPointA***

Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the *scs-SpecificCarrierList*.

***frequencyBandList***

Provides the frequency band indicator and a list of *additionalPmax* and *additionalSpectrumEmission* values as defined in TS 38.101-1 [15], table 6.2.3.1-1, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1. The UE shall apply the first listed band which it supports in the *frequencyBandList* field. If *frequencyBandList-v1760* is present, it shall contain the same number of entries, listed in the same order as in *frequencyBandList* (without suffix).

***frequencyBandListAerial***

Provides the frequency band indicator and a list of *additionalPmax* and *additionalSpectrumEmission* values for aerial UE as defined in TS 38.101-1 [15], clause 6.2K. If the field is present, the aerial UE shall apply the first listed band which it supports in the *frequencyBandListAerial* field. If the field is absent, *frequencyBandList* applies.

***frequencyShift7p5khz***

Enable the NR UL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.

***p-Max***

Value in dBm applicable for the cell. If absent the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if p-Max is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emission requirements as specified in TS 38.106 [79].

***scs-SpecificCarrierList***

A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A (see TS 38.211 [16], clause 5.3). The network configures this for all SCSs that are used in UL BWPs configured in this serving cell.

| Conditional Presence          | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD-OrSUL</i>              | The field is mandatory present if this <i>FrequencyInfoUL-SIB</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL-SIB</i> ) or if this <i>FrequencyInfoUL-SIB</i> is for a supplementary uplink (SUL). It is absent otherwise (if this <i>FrequencyInfoUL-SIB</i> is for an unpaired UL (TDD)).                                                                                                                     |
| <i>FDD-TDD-OrSUL-Optional</i> | The field is optionally present, Need R, if this <i>FrequencyInfoUL-SIB</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL-SIB</i> ), or if this <i>FrequencyInfoUL-SIB</i> is for an unpaired UL (TDD) in certain bands (as defined in clause 5.4.2.1 of TS 38.101-1 and in clause 5.4.2.1 of TS 38.104 [12]), or if this <i>FrequencyInfoUL-SIB</i> is for a supplementary uplink (SUL). It is absent otherwise. |

### HighSpeedConfig field descriptions

#### HighSpeedDemodCA-Scell

If the field is present and UE supports *demodulationEnhancementCA-r17*, the UE shall apply the enhanced demodulation processing for HST-SFN joint transmission scheme with velocity up to 500km/h as specified in TS 38.101-4 [59]. This parameter only applies to SCell.

#### highSpeedDemodFlag

If the field is present and UE supports *demodulationEnhancement-r16*, the UE shall apply the enhanced demodulation processing for HST-SFN joint transmission scheme with velocity up to 500km/h as specified in TS 38.101-4 [59]. This parameter only applies to SpCell.

#### highSpeedDeploymentTypeFR2

If the field is present, and field value is *unidirectional*, the UE shall assume uni-directional deployment or if field value is *birectional* the UE shall assume bidirectional deployment for FR2 up to 350km/h as specified in TS 38.133 [14].

#### highSpeedLargeOneStepUL-TimingFR2

If the field is present, large one step UE autonomous uplink transmit timing adjustment for FR2 up to 350km/h as specified in TS 38.133 [14] is enabled.

#### highSpeedMeasCA-Scell

If the field is present and UE supports *measurementEnhancementCA-r17*, the UE shall apply the enhanced RRM requirements to the serving frequency of SCell for carrier aggregation to support high speed up to 500 km/h as specified in TS 38.133 [14].

#### highSpeedMeasFlag

If the field is present and UE supports *measurementEnhancement-r16*, the UE shall apply the enhanced intra-NR and inter-RAT EUTRAN RRM requirements to support high speed up to 500 km/h as specified in TS 38.133 [14].

If the field is present and UE supports *intraNR-MeasurementEnhancement-r16*, the UE shall apply enhanced intra-NR RRM requirement to support high speed up to 500 km/h as specified in TS 38.133 [14].

If the field is present and UE supports *interRAT-MeasurementEnhancement-r16*, the UE shall apply enhanced inter-RAT EUTRAN RRM requirement to support high speed up to 500 km/h as specified in TS 38.133 [14].

This parameter only applies to the serving frequency of SpCell.

#### highSpeedMeasFlagFR2

If the field is present and UE supports *ue-PowerClass-v1700* set to *pc6*, the UE shall apply enhanced intra-frequency RRM requirement to the serving frequency of SpCell to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14].

If the field is present and the UE supports enhanced inter-frequency RRM requirements for FR2 HST in RRC\_IDLE and RRC\_INACTIVE, the UE shall apply enhanced inter-frequency RRM requirement to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14] in RRC\_IDLE and RRC\_INACTIVE.

If the field is present for SpCell and the UE supports *measEnhCAInterFreqFR2-r18*, the UE shall apply enhanced inter-frequency RRM requirement to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14] in RRC\_CONNECTED.

If the field is present for SCell(s) and the UE supports *measEnhCAInterFreqFR2-r18*, the UE shall apply enhanced intra-frequency RRM requirements to the serving frequency of the corresponding SCell to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14] in RRC\_CONNECTED. If the UE is configured with intra-band CA and the field *highSpeedMeasFlagFR2* is present, the network configures the same value for all serving cells.

The field value, *set1* or *set2*, is applied as specified in TS38.133 [14].

#### highSpeedMeasInterFreq

If the field is present and UE supports *measurementEnhancementInterFreq-r17*, the UE shall apply the enhanced RRM requirements for inter-frequency measurement in RRC\_CONNECTED to support high speed up to 500 km/h as specified in TS 38.133 [14].

| Conditional Presence | Explanation                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SCellOnly</i>     | The field is optionally present, Need R, in <i>ServingCellConfigCommon</i> of an SCell. It is absent otherwise.                                              |
| <i>SpCellOnly</i>    | The field is optionally present, Need R, in <i>ServingCellConfigCommonSIB</i> or in the <i>ServingCellConfigCommon</i> of an SpCell. It is absent otherwise. |
| <i>SpCellOnly2</i>   | The field is optionally present, Need R, in <i>ServingCellConfigCommon</i> of an SpCell. It is absent otherwise.                                             |

## — *Hysteresis*

The IE *Hysteresis* is a parameter used within the entry and leave condition of an event triggered reporting condition. The actual value is field value \* 0.5 dB.

### ***Hysteresis* information element**

```
-- ASN1START
-- TAG-HYSTERESIS-START

Hysteresis ::=
    INTEGER (0..30)

-- TAG-HYSTERESIS-STOP
-- ASN1STOP
```

## — *HysteresisAltitude*

The IE *HysteresisAltitude* is a parameter used within the entry and leave condition of an altitude-based event triggered reporting condition and within altitude range based parameter configuration. The actual value is field value in meters.

### ***HysteresisAltitude* information element**

```
-- ASN1START
-- TAG-HYSTERESISALTITUDE-START

HysteresisAltitude-r18 ::=
    INTEGER (0..64)

-- TAG-HYSTERESISALTITUDE-STOP
-- ASN1STOP
```

## — *HysteresisLocation*

The IE *HysteresisLocation* is a parameter used within entry and leave condition of a location based event triggered reporting condition. The actual value is field value \* 10 meters.

***HysteresisLocation* information element**

```
-- ASN1START
-- TAG-HYSTERESISLOCATION-START
```

```
HysteresisLocation-r17 ::= INTEGER (0..32768)
```

```
-- TAG-HYSTERESISLOCATION-STOP
-- ASN1STOP
```

— ***InvalidSymbolPattern***

The IE *InvalidSymbolPattern* is used to configure one invalid symbol pattern for PUSCH transmission repetition type B applicable for both DCI format 0\_1 and 0\_2, see TS 38.214 [19], clause 6.1.

***InvalidSymbolPattern* information element**

```
-- ASN1START
-- TAG-INVALIDSYMBOLPATTERN-START
```

```
InvalidSymbolPattern-r16 ::= SEQUENCE {

| <b>carrierFreq</b><br>The EARFCN value of the carrier received from upper layers for which the UE needs to perform the inter-RAT RSTD measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>measPRS-Offset</b><br>Indicates the requested gap offset for performing RSTD measurements towards E-UTRA. It is the smallest subframe offset from the beginning of subframe 0 of SFN=0 of the serving cell of the requested gap for measuring PRS positioning occasions in the carrier frequency <i>carrierFreq</i> for which the UE needs to perform the inter-RAT RSTD measurements. The PRS positioning occasion information is received from upper layers. The value of <i>measPRS-Offset</i> is obtained by mapping the starting subframe of the PRS positioning occasion in the measured cell onto the corresponding subframe in the serving cell and is calculated as the serving cell's number of subframes from SFN=0 mod 40.<br>The UE shall take into account any additional time required by the UE to start PRS measurements on the other carrier when it does this mapping for determining the <i>measPRS-Offset</i> .<br>NOTE: Figure 6.2.2-1 in TS 36.331[10] illustrates the <i>measPRS-Offset</i> field. |
| <b>dl-PRS-PointA</b><br>The ARFCN value of the carrier received from upper layers for which the UE needs to perform the NR DL-PRS measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>nr-MeasPRS-RepetitionAndOffset</b><br>Indicates the gap periodicity in ms and offset in number of subframes of the requested measurement gap for performing NR DL-PRS measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>nr-MeasPRS-length</b><br>Indicates measurement gap length in ms of the requested measurement gap for performing NR DL-PRS measurements. The measurement gap length is according to in Table 9.1.2-1 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## – *LogicalChannelConfig*

The IE *LogicalChannelConfig* is used to configure the logical channel parameters.

| <i>LogicalChannelConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>allowedCG-List</i></b><br/>This restriction applies only when the UL grant is a configured grant. If present, UL MAC SDUs from this logical channel can only be mapped to the indicated configured grant configuration. If the size of the sequence is zero, then UL MAC SDUs from this logical channel cannot be mapped to any configured grant configurations. If the field is not present, UL MAC SDUs from this logical channel can be mapped to any configured grant configurations. If the field <i>configuredGrantType1Allowed</i> is present, only those configured grant type 1 configuration indicated in this sequence are allowed for use by this logical channel; otherwise, this sequence shall not include any configured grant type 1 configuration. Corresponds to "allowedCG-List" as specified in TS 38.321 [3]. This field is ignored when SDT procedure is ongoing.</p> |
| <p><b><i>allowedHARQ-mode</i></b><br/>Indicates the allowed HARQ mode of a HARQ process mapped to this logical channel. If the parameter is absent, there is no restriction for HARQ mode for the mapping. This field applies to SRB1, SRB2, SRB4 and DRBs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>allowedPHY-PriorityIndex</i></b><br/>This restriction applies only when the UL grant is a dynamic grant. If the field is present and the dynamic grant has a PHY-priority index, UL MAC SDUs from this logical channel can only be mapped to the dynamic grants indicating PHY-priority index equal to the values configured by this field. If the field is present and the dynamic grant does not have a PHY-priority index, UL MAC SDUs from this logical channel can only be mapped to this dynamic grant if the value of the field is <i>p0</i>, see TS 38.213 [13], clause 9. If the field is not present, UL MAC SDUs from this logical channel can be mapped to any dynamic grants. Corresponds to "allowedPHY-PriorityIndex" as specified in TS 38.321 [3].</p>                                                                                                                      |
| <p><b><i>allowedSCS-List</i></b><br/>If present, UL MAC SDUs from this logical channel can only be mapped to the indicated numerology. Otherwise, UL MAC SDUs from this logical channel can be mapped to any configured numerology. Corresponds to '<i>allowedSCS-List</i>' as specified in TS 38.321 [3].<br/>Only the following values are applicable depending on the used frequency:<br/>FR1: 15, 30, or 60 kHz<br/>FR2-1/FR2-NTN: 60 or 120 kHz<br/>FR2-2: 120, 480, or 960 kHz</p>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>allowedServingCells</i></b><br/>If present, UL MAC SDUs from this logical channel can only be mapped to the serving cells indicated in this list. Otherwise, UL MAC SDUs from this logical channel can be mapped to any configured serving cell of this cell group. Corresponds to '<i>allowedServingCells</i>' in TS 38.321 [3].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>bitRateMultiplier</i></b><br/>Bit rate multiplier for recommended bit rate MAC CE as specified in TS 38.321 [3]. Value <i>x40</i> indicates bit rate multiplier 40, value <i>x70</i> indicates bit rate multiplier 70 and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b><i>bitRateQueryProhibitTimer</i></b><br/>The timer is used for bit rate recommendation query in TS 38.321 [3], in seconds.  **LTE-NeighCellsCRS-AssistInfoList**

The IE *LTE-NeighCellsCRS-AssistInfoList-r17* is used to provide configuration information of neighbour LTE cells to assist the UE to perform CRS interference mitigation (CRS-IM) in scenarios with overlapping spectrum for LTE and NR.

**LTE-NeighCellsCRS-AssistInfoList** information element

```

-- ASN1START
-- TAG-LTE-NEIGHCELLSCRS-ASSISTINFOLIST-START

```

```

LTE-NeighCellsCRS-AssistInfoList-r17 ::= SEQUENCE (SIZE (1..maxNrofCRS-IM-InterfCell-r17)) OF LTE-NeighCellsCRS-AssistInfo-r17

LTE-NeighCellsCRS-AssistInfo-r17 ::= SEQUENCE {
    neighCarrierBandwidthDL-r17      ENUMERATED {n6, n15, n25, n50, n75, n100, spare2, spare1} OPTIONAL, -- Cond CRS-IM

-- ASN1STOP

```

#### ***LTE-NeighCellsCRS-AssistInfo* field descriptions**

##### ***neighCarrierBandwidthDL***

Indicates the channel bandwidth of the neighbour LTE cell in number of PRBs. If the field is absent, the UE applies the value of *carrierBandwidthDL* indicated in *RateMatchPatternLTE-CRS* for this serving cell, if configured.

##### ***neighCarrierFreqDL***

Indicates the downlink centre frequency of the neighbour LTE cell. If the field is absent, the UE applies the value of *carrierFreqDL* indicated in *RateMatchPatternLTE-CRS* for this serving cell, if configured.

##### ***neighCellId***

Indicates the physical cell ID of the neighbour LTE cell for which the other fields within the same *LTE-NeighCellsCRS-AssistInfo* apply.

If the IE *LTE-NeighCellsCRS-AssistInfoList* contains multiple list entries, either this field or *neighV-Shift* is included in each instance.

If the IE *LTE-NeighCellsCRS-AssistInfoList* contains multiple list entries, the entry with *neighV-Shift* is only used for neighbour LTE cells for which *neighCellId* is not provided (i.e. the entry with *neighCellId* takes precedence over the entry with *neighV-Shift*, if provided).

If the IE *LTE-NeighCellsCRS-AssistInfoList* contains one list entry with neither this field nor *neighV-Shift*, the information within the entry applies to all neighbour LTE cells.

##### ***neighCRS-muting***

Indicates whether the CRS interference mitigation is enabled in the neighbour LTE cell, as specified in TS 36.133 [40], clause 3.6.1.1.

##### ***neighMBSFN-SubframeConfigList***

Indicates the MBSFN subframe configuration of the neighbour LTE cell. If *RateMatchPatternLTE-CRS* is configured for this serving cell and the field is absent, the UE applies the value of *mbsfn-SubframeConfigList* indicated in *RateMatchPatternLTE-CRS* for this serving cell if configured; otherwise, if the field is absent, the UE assumes MBSFN is not configured in the neighbour LTE cell.

##### ***neighNrofCRS-Ports***

Indicates the CRS antenna ports number of the neighbour LTE cell. If the field is absent, the UE applies the value of *nrofCRS-Ports* indicated in *RateMatchPatternLTE-CRS* for this serving cell, if configured. If *RateMatchPatternLTE-CRS* is not configured for this serving cell and the field is absent, the UE applies the default value *n4*.

##### ***neighV-Shift***

Indicates the shifting value *v-shift* of neighbour LTE cells for which the other fields within the same *LTE-NeighCellsCRS-AssistInfo* apply.

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

```

#### ***LTM-Candidate* field descriptions**

##### ***ltm-CandidateConfig***

This field includes an RRCReconfiguration message used to configure an LTM candidate configuration.

##### ***ltm-CandidatePCI***

This field identifies the PCI of the SpCell of the LTM candidate configuration contained in *ltm-CandidateConfig*.

##### ***ltm-EarlyUL-SyncConfig*, *ltm-EarlyUL-SyncConfigSUL***

A configuration used to perform the early UL synchronization procedure over an UL or SUL carrier.

##### ***ltm-NoResetID***

If the network configures this field for one LTM candidate configuration, the network configures also for all LTM candidate configurations within *ltm-CandidateToAddModList* in *LTM-Config* and ensures that the UE has stored a value for *ltm-ServingCellNoResetID* within *VarLTM-ServingCellNoResetID*.

##### ***ltm-UE-MeasuredTA-ID***

If the network configures this field for one LTM candidate configuration, the network configures also for all LTM candidate configurations within *ltm-CandidateToAddModList* in *LTM-Config* and ensures that the UE has stored a value for *ltm-ServingCellUE-MeasuredTA-ID* within *VarLTM-ServingCellUE-MeasuredTA-ID*. This field is absent if *tag2* is present for this LTM candidate configuration.

#### ***LTM-SSB-Config* field descriptions**

##### ***ssb-Periodicity***

The SSB periodicity in ms. If the field is absent, the UE applies the value *ms5*. (see TS 38.213 [13], clause 4.1).

##### ***ssb-PositionsInBurst***

For operation in licensed spectrum, indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. The network always includes this field if *ltm-SSB-Config* is configured.

##### ***ss-PBCH-BlockPower***

Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7. The network always includes this field if *ltm-SSB-Config* is configured.

## – *LTM-Config*

The IE *LTM-Config* is used to provide LTM configurations.

#### **LTM-ReportContent field descriptions**

##### **nrOfReportedCells**

This field defines how many cells are reported within a single L1 measurement report instance.

##### **nrOfReportedRS-PerCell**

This field defines how many RSs per cell are reported within a single L1 measurement report instance.

##### **spCellInclusion**

This field indicates whether the UE shall include a L1 measurement report associated to the current SpCell. This field can only be configured if the current SpCell is configured as an SpCell of an LTM candidate configuration and the *LTM-CSI-ResourceConfig* IE associated to the *LTM-CSI-ReportConfig* IE includes resources for the current SpCell.

## – *LTM-CSI-ReportConfigId*

The IE *LTM-CSI-ReportConfigId* is used to identify an *LTM-CSI-ReportConfig*.

### *LTM-CSI-ReportConfigId* information element

```
-- ASN1START
-- TAG-LTM-CSI-REPORTCONFIGID-START

LTM-CSI-ReportConfigId-r18 ::=          INTEGER (0..maxNrofLTM-CSI-ReportConfigurations-1-r18)

-- TAG-LTM-CSI-REPORTCONFIGID-STOP
-- ASN1STOP
```

## – *LTM-CSI-ResourceConfig*

The IE *LTM-CSI-ResourceConfig* defines a group of one or more CSI resources for one or more LTM candidate configurations.

### *LTM-CSI-ResourceConfig* information element

```
-- ASN1START
-- TAG-LTM-CSI-RESOURCECONFIG-START

LTM-CSI-ResourceConfig-r18 ::=          SEQUENCE {
    ltm-CSI-ResourceConfigId-r18          LTM-CSI-ResourceConfigId-r18,

    ...
}

-- TAG-LTM-CSI-RESOURCECONFIG-STOP
-- ASN1STOP
```

### *LTM-CSI-SSB-ResourceSet* field descriptions

#### *ltm-CandidateIdList*

This field indicates the LTM candidate configuration IDs related to the SSBs in the *ltm-CSI-SSB-ResourceList*. The list has the same number of entries as *ltm-CSI-SSB-ResourceList*. The first entry in this list shall be associated to the first entry in *ltm-CSI-SSB-ResourceList*, the second entry of this list shall be associated to the second entry in *ltm-CSI-SSB-ResourceList*, and so on.

#### *ltm-CSI-SSB-ResourceList*

This field is used to indicate on SS/PBCH block resources from one or more LTM candidate cells.

## – *LTM-CSI-ResourceConfigId*

The IE *LTM-CSI-ResourceConfigId* is used to identify an *LTM-CSI-ResourceConfig*.

### *LTM-CSI-ResourceConfigId* information element

```
-- ASN1START
-- TAG-LTM-CSI-RESOURCECONFIGID-START

## – *LTM-TCI-Info*

The IE *LTM-TCI-Info* is used to configure TCI related information for an LTM candidate configuration to be used during activation of TCI state(s) and/or upon the reception of the LTM Cell Switch procedure.

### *LTM-TCI-Info* information element

### LTM-TCI-Info field descriptions

#### unifiedTCI-StateType

Indicates the unified TCI states type the UE is configured for this LTM candidate configuration. The value *separate* means this LTM candidate configuration is configured with *ltn-DL-OrJointTCI-StateToAddModList* for DL TCI states and *ltn-UL-TCI-StateToAddModList* for UL TCI states. The value *joint* means this LTM candidate configuration is configured with *ltn-DL-OrJointTCI-StateToAddModList* for joint TCI states for UL and DL operation. The network always configures this field.

### MAC-CellGroupConfig

The IE *MAC-CellGroupConfig* is used to configure MAC parameters for a cell group, including DRX.

| Indicates whether the UE shall provide HARQ feedback for MBS multicast. Value <i>dci-enabler</i> means that whether the UE shall provide HARQ feedback for MBS multicast is indicated by DCI as specified in TS 38.213 [13]. Value <i>enabled</i> means the UE shall always provide HARQ feedback for MBS multicast. When the field is absent, the UE behavior is specified in TS 38.213 [13]. |

It is absent otherwise.                                                                                                                                                                 |
| <i>MCG-Only</i>              | This field is optionally present, Need M, for the <i>MAC-CellGroupConfig</i> of the MCG. It is absent otherwise.                                                                                                                                                             |
| <i>LCH-PrioWithReTxTimer</i> | This field is optionally present, Need R, if <i>lch-BasedPrioritization-r16</i> is configured in this MAC entity and <i>cg-RetransmissionTimer-r16</i> is configured for any configured grant configuration associated with this MAC entity. It is absent otherwise, Need R. |

## – MeasConfig

The IE *MeasConfig* specifies measurements to be performed by the UE, and covers intra-frequency, inter-frequency and inter-RAT mobility as well as configuration of measurement gaps.

| <p><b>gapAssociationPRS</b><br/>Indicates that PRS measurement is associated with this measurement gap. The network only includes this field for one per-UE gap or for one per-FR gap. If concurrent gap (i.e. one of the gap combination as defined in Table 9.1.8-1 in TS 38.133 [14]) is configured and no gap is configured with this field, the PRS measurement is associated with the gap configured via <i>GapConfig</i> (without suffix), if available. If both per-UE gap and per-FR gap are configured via <i>GapConfig</i> and/or <i>GapConfig-r17</i>, the PRS measurement is always associated with the per-UE gap.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>gapFR1</b><br/>Indicates measurement gap configuration that applies to FR1 only. In (NG)EN-DC, <i>gapFR1</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure FR1 measurement gap). In NE-DC, <i>gapFR1</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR1 gap). In NR-DC, <i>gapFR1</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapFR1</i> can not be configured together with <i>gapUE</i>. The applicability of the FR1 measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 in TS 38.133 [14].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>gapFR2</b><br/>Indicates measurement gap configuration applies to FR2 only. In (NG)EN-DC or NE-DC, <i>gapFR2</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR2 gap). In NR-DC, <i>gapFR2</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapFR2</i> cannot be configured together with <i>gapUE</i>. The applicability of the FR2 measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 in TS 38.133 [14].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>gapOffset</b><br/>Value <i>gapOffset</i> is the gap offset of the gap pattern with MGRP indicated in the field <i>mgrp</i>. The value range is from 0 to <i>mgrp</i>-1. If <i>ncsgInd-r17</i> is present, this offset value refers to the starting point of VIL1 (the visible interruption length before the ML).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>gapPriority</b><br/>Indicates the priority of this measurement gap (see TS 38.133 [14]). Value 1 indicates highest priority, value 2 indicates second level priority, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>gapSharing</b><br/>Indicates the measurement gap sharing scheme that applies to this <i>GapConfig</i>. For applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>gapToAddModList</b><br/>A list of measurement gap configuration to be added or modified. If more than one measurement gap is configured (i.e. concurrent measurement gap as specified in TS 38.133[14], clause 9.1.8 for TN or clause 9.1C.8 for NTN), the maximum number of configured measurement gap is limited by the gap combinations defined in Table 9.1.8-1 in TS 38.133 [14] for TN. For NTN the maximum number of configured measurement gap is limited by UE capability indicated in <i>parallelMeasurementGap</i>. In this version of the specification, the network configures this field only in NR standalone. This field is used only for a UE that supports pre-configured measurement gap, concurrent measurement gap, or NCSG. In this version of the specification, the network does not configure concurrent measurement gap together with preconfigured measurement gap for positioning. For the UE supporting the capability of <i>musim-GapPriorityPreference</i>, the network can configure concurrent measurement gap together with MUSIM gap. Otherwise, the network does not configure concurrent measurement gap together with MUSIM gap.</p> |
| <p><b>gapToReleaseList</b><br/>A list of measurement gap configuration to be released.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>gapType</b><br/>Indicates the type of this measurement gap. Value <i>perUE</i> indicates that it is a per UE measurement gap, value <i>perFR1</i> indicates that it is an FR1 measurement gap, and value <i>perFR2</i> indicates that it is an FR2 measurement gap.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>gapUE</b><br/>Indicates measurement gap configuration that applies to all frequencies (FR1 and FR2). In (NG)EN-DC, <i>gapUE</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure per UE measurement gap). In NE-DC, <i>gapUE</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure per UE gap). In NR-DC, <i>gapUE</i> can only be set up in the <i>measConfig</i> associated with MCG. If <i>gapUE</i> is configured, then neither <i>gapFR1</i> nor <i>gapFR2</i> can be configured. For TN, the applicability of the per UE measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 for non-RedCap UEs, and Table 9.1A.2-2 for RedCap UEs in TS 38.133 [14]. For NTN, the applicability of per UE measurement gap is according to subclause 9.1C.2 in TS 38.133 [14].</p>                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>measGapId</b><br/>The ID of this measurement gap configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>mgl</i></b>                              | Value <i>mgl</i> is the measurement gap length in ms of the measurement gap. If <i>ncsglnd-r17</i> is not present, the measurement gap length is according to Table 9.1.2-1 for non-RedCap UEs in TN, Table 9.1A.2-1 for RedCap UEs in TN, and Table 9.1C.2-1 for NTN in TS 38.133 [14]. If <i>ncsglnd-r17</i> is present, this field indicates the measurement length (ML) in NCSG pattern and is configured according to Table 9.1.9.3-1 in TS 38.133 [14]. Value <i>ms1dot5</i> corresponds to 1.5 ms, <i>ms3</i> corresponds to 3 ms and so on. If <i>mgl-r16</i> is present, UE shall ignore the <i>mgl</i> (without suffix). Value <i>ms1</i> , <i>ms2</i> , and <i>ms5</i> can only be configured if <i>ncsglnd</i> is present.                                                                                   |
| <b><i>mgrp</i></b>                             | If <i>ncsglnd-r17</i> is not present, the <i>mgrp</i> field indicates the measurement gap repetition period in (ms) of the measurement gap according to Table 9.1.2-1 for non-RedCap UEs in TN, Table 9.1A.2-1 for RedCap UEs in TN, and Table 9.1C.2-1 for NTN in TS 38.133 [14]. If <i>ncsglnd-r17</i> is present, the <i>mgrp</i> field indicates the Visible Interruption Repetition Period (VIRP) of NCSG pattern and is configured according to Table 9.1.9.3-1 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                 |
| <b><i>mgta</i></b>                             | Value <i>mgta</i> is the measurement gap timing advance in ms. The applicability of the measurement gap timing advance is according to clause 9.1.2 for non-RedCap UEs in TN, clause 9.1A.2 for RedCap UEs in TN, and clause 9.1C.2 for NTN of TS 38.133 [14], or according to clause 9.1.9 of TS 38.133 [14] if <i>ncsglnd</i> is present. Value <i>ms0</i> corresponds to 0 ms, <i>ms0dot25</i> corresponds to 0.25 ms, <i>ms0dot5</i> corresponds to 0.5 ms and <i>ms0dot75</i> corresponds to 0.75 ms. For FR2, the network only configures 0 ms and 0.25 ms if <i>ncsglnd</i> is not present. If <i>ncsglnd</i> is present, the network only configures 0ms for per-UE NCSG and FR1 NCSG and only configures 0ms or 0.75ms for FR2 NCSG. Value <i>ms0dot75</i> can only be configured if <i>ncsglnd</i> is present. |
| <b><i>ncsglnd</i></b>                          | Indicates that the measurement gap is a NCSG as specified in 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>posMeasGapPreConfigToAddModList</i></b>  | List of preconfigured measurement gap for positioning to add and/or modify. All the gaps configured are associated with the measurement of PRS for RSTD, UE-RxTx Time Difference, PRS-RSRP and PRS-RSRPP as defined in TS 38.215 [9]. In this version of the specification, the network does not configure preconfigured measurement gap for positioning together with concurrent measurement gap or MUSIM gap.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>posMeasGapPreConfigToReleaseList</i></b> | List of preconfigured measurement gap for positioning to release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>preConfigInd</i></b>                     | Indicates whether the measurement gap is a pre-configured measurement gap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>refFR2ServCellAsyncCA</i></b>            | Indicates the FR2 serving cell identifier whose SFN and subframe is used for FR2 gap calculation for this gap pattern with asynchronous CA involving FR2 carrier(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>refServCellIndicator</i></b>             | Indicates the serving cell whose SFN and subframe are used for gap calculation for this gap pattern. Value pCell corresponds to the PCell, pSCell corresponds to the PSCell, and mcg-FR2 corresponds to a serving cell on FR2 frequency in MCG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>AsyncCA</i>       | This field is mandatory present when configuring and reconfiguring FR2 gap pattern to UE in: <ul style="list-style-type: none"> <li>- (NG)EN-DC or NR SA with asynchronous CA involving FR2 carrier(s);</li> <li>- NE-DC or NR-DC with asynchronous CA involving FR2 carrier(s), if the field <i>refServCellIndicator</i> is set to <i>mcg-FR2</i>.</li> </ul> Otherwise, it is absent, Need R. |
| <i>NEDCorNRDC</i>    | This field is mandatory present when configuring and reconfiguring gap pattern to UE in NE-DC or NR-DC. Otherwise, it is absent, Need R.                                                                                                                                                                                                                                                        |
| <i>PRS</i>           | This field is optionally present, Need R, when configuring gap pattern to UE for measurements of DL-PRS configured via LPP (TS 37.355 [49]). Otherwise, it is absent.                                                                                                                                                                                                                           |

– *MeasGapId*

The IE *MeasGapId* used to identify a per UE or per FR measurement gap configuration.

***MeasGapId* information element**

```
-- ASN1START
-- TAG-MEASGAPID-START

MeasGapId-r17 ::=
    INTEGER (1..maxNrofGapId-r17)

-- TAG-MEASGAPID-STOP
-- ASN1STOP
```

***MeasGapSharingConfig***

The IE *MeasGapSharingConfig* specifies the measurement gap sharing scheme and controls setup/ release of measurement gap sharing.

***MeasGapSharingConfig* information element**

```
-- ASN1START
-- TAG-MEASGAPSHARINGCONFIG-START

MeasGapSharingConfig ::=
    SEQUENCE {
        gapSharingFR2
            SetupRelease { MeasGapSharingScheme }    OPTIONAL, -- Need M
        ...,
        [[
            gapSharingFR1
                SetupRelease { MeasGapSharingScheme }    OPTIONAL, --Need M
            gapSharingUE
                SetupRelease { MeasGapSharingScheme }    OPTIONAL --Need M
        ]]
    }

MeasGapSharingScheme ::=
    ENUMERATED {scheme00, scheme01, scheme10, scheme11}

-- TAG-MEASGAPSHARINGCONFIG-STOP
-- ASN1STOP
```

| <i>MeasGapSharingConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>gapSharingFR1</b><br/>Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapFR1</i>. In (NG)EN-DC, <i>gapSharingFR1</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure FR1 gap sharing). In NE-DC, <i>gapSharingFR1</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR1 gap sharing). In NR-DC, <i>gapSharingFR1</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapSharingFR1</i> can not be configured together with <i>gapSharingUE</i>. For the applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.</p>                                        |
| <p><b>gapSharingFR2</b><br/>Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapFR2</i>. In (NG)EN-DC or NE-DC, <i>gapSharingFR2</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR2 gap sharing). In NR-DC, <i>gapSharingFR2</i> can only be set up by MCG in the <i>measConfig</i> associated with MCG. <i>gapSharingFR2</i> cannot be configured together with <i>gapSharingUE</i>. For applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.</p>                                                                                                                                          |
| <p><b>gapSharingUE</b><br/>Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapUE</i>. In (NG)EN-DC, <i>gapSharingUE</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure per UE gap sharing). In NE-DC, <i>gapSharingUE</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure per UE gap sharing). In NR-DC, <i>gapSharingUE</i> can only be set up in the <i>measConfig</i> associated with MCG. If <i>gapSharingUE</i> is configured, then neither <i>gapSharingFR1</i> nor <i>gapSharingFR2</i> can be configured. For the applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.</p> |

## – *MeasId*

The IE *MeasId* is used to identify a measurement configuration, i.e., linking of a measurement object and a reporting configuration.

### *MeasId* information element

```
-- ASN1START
-- TAG-MEASID-START

MeasId ::= INTEGER (1..maxNrofMeasId)

-- TAG-MEASID-STOP
-- ASN1STOP
```

## – *MeasIdleConfig*

The IE *MeasIdleConfig* is used to convey information to UE about measurements requested to be done while in RRC\_IDLE or RRC\_INACTIVE.

### *MeasIdleConfig* information element

```
-- ASN1START
-- TAG-MEASIDLECONFIG-START

| <i>MeasIdleConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absThreshSS-BlocksConsolidation</i></b><br>Threshold for consolidation of L1 measurements per RS index.                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>beamMeasConfigIdle</i></b><br>Indicates the beam level measurement configuration.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>carrierFreq</i></b><br>Indicates the NR carrier frequency to be used for measurements during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>carrierFreqEUTRA</i></b><br>Indicates the E-UTRA carrier frequency to be used for measurements during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                                                                |
| <b><i>deriveSSB-IndexFromCell</i></b><br>This field indicates whether the UE may use the timing of any detected cell on that frequency to derive the SSB index of all neighbour cells on that frequency. If this field is set to true, the UE assumes SFN and frame boundary alignment across cells on the neighbor frequency as specified in TS 38.133 [14].                                                                                                                        |
| <b><i>frequencyBandList</i></b><br>Indicates the list of frequency bands for which the NR idle/inactive measurement parameters apply. The UE shall select the first listed band which it supports in the frequencyBandList field to represent the NR neighbour carrier frequency.                                                                                                                                                                                                    |
| <b><i>includeBeamMeasurements</i></b><br>Indicates whether or not the UE shall include beam measurements in the NR idle/inactive measurement results.                                                                                                                                                                                                                                                                                                                                |
| <b><i>maxNrofRS-IndexesToReport</i></b><br>Max number of beam indices to include in the idle/inactive measurement result.                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>measCellListEUTRA</i></b><br>Indicates the list of E-UTRA cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                                                                                                                                |
| <b><i>measCellListNR</i></b><br>Indicates the list of NR cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                                                                                                                                       |
| <b><i>measIdleCarrierListEUTRA</i></b><br>Indicates the E-UTRA carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>measIdleCarrierListNR</i></b><br>Indicates the NR carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>measIdleCarrierListNR-LessThan5MHz</i></b><br>Indicates the NR carriers to be measured during RRC_IDLE or RRC_INACTIVE for the cell(s) supporting 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Total number of <i>MeasIdleCarrierNR</i> included in <i>measIdleCarrierListNR</i> and <i>measIdleCarrierListNR-LessThan5MHz</i> does not exceed <i>maxFreqIdle-r16</i> .                    |
| <b><i>measIdleDuration</i></b><br>Indicates the duration for performing idle/inactive measurements while in RRC_IDLE or RRC_INACTIVE. Value sec10 correspond to 10 seconds, value sec30 to 30 seconds and so on.                                                                                                                                                                                                                                                                     |
| <b><i>measIdleValidityDuration, measReselectionValidityDuration</i></b><br>Indicates time values for UE to determine validity of reported idle/inactive and reselection measurements as defined in TS 38.133[14]. Value s5 correspond to 5 seconds, value s10 correspond to 10 seconds and so on.                                                                                                                                                                                    |
| <b><i>measReselectionCarrierListNR</i></b><br>Indicates the NR carriers for reselection measurement reporting.                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>measReselectionCarrierListNR-LessThan5MHz</i></b><br>Indicates the NR carriers for reselection measurement reporting for the cell(s) supporting 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Total number of <i>MeasReselectionCarrierNR</i> included in <i>measReselectionCarrierListNR</i> and <i>measReselectionCarrierListNR-LessThan5MHz</i> does not exceed <i>maxFreqIdle-r16</i> . |
| <b><i>nrofSS-BlocksToAverage</i></b><br>Number of SS blocks to average for cell measurement derivation.                                                                                                                                                                                                                                                                                                                                                                              |

|                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>qualityThreshold</b>                                                                                                                                                                              |
| Indicates the quality thresholds for reporting the measured cells for idle/inactive NR measurements.                                                                                                 |
| <b>qualityThresholdEUTRA</b>                                                                                                                                                                         |
| Indicates the quality thresholds for reporting the measured cells for idle/inactive E-UTRA measurements.                                                                                             |
| <b>reportQuantities</b>                                                                                                                                                                              |
| Indicates which measurement quantities UE is requested to report in the idle/inactive measurement report.                                                                                            |

| Indicates which E-UTRA measurement quantities the UE is requested to report in the idle/inactive measurement report.                                                                                 |
| <b>reportQuantityRS-Indexes</b>                                                                                                                                                                      |
| Indicates which measurement information per beam index the UE shall include in the NR idle/inactive measurement results.                                                                             |
| <b>smtc</b>                                                                                                                                                                                          |
| Indicates the measurement timing configuration for inter-frequency measurement. If this field is absent in <i>VarMeasIdleConfig</i> , the UE assumes that SSB periodicity is 5 ms in this frequency. |
| <b>ssbSubcarrierSpacing</b>                                                                                                                                                                          |
| Indicates subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz       |
| <b>ssb-ToMeasure</b>                                                                                                                                                                                 |
| The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]). When the field is absent in <i>VarMeasIdleConfig</i> , the UE measures on all SS-blocks.               |
| <b>ss-RSSI-Measurement</b>                                                                                                                                                                           |
| Indicates the SSB-based RSSI measurement configuration. If the field is absent in <i>VarMeasIdleConfig</i> , the UE behaviour is defined in TS 38.215 [89], clause 5.1.3.                            |
| <b>validityAreaList</b>                                                                                                                                                                              |
| Indicates the list of frequencies and optionally, for each frequency, a list of cells within which the UE is required to perform measurements while in RRC_IDLE and RRC_INACTIVE.                    |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LessThan5MHz</i>  | The field is mandatory present if the <i>carrierBandwidth</i> in SIB1 indicates UL or DL transmission bandwidth other than 15 PRB and the corresponding neighbour cell(s) support(s) 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Otherwise, the field is optional, Need R. |

– *MeasIdToAddModList*

The IE *MeasIdToAddModList* concerns a list of measurement identities to add or modify, with for each entry the *measId*, the associated *measObjectId* and the associated *reportConfigId*.

*MeasIdToAddModList* information element

```

-- ASN1START
-- TAG-MEASIDTOADDMODLIST-START

MeasIdToAddModList ::=
    SEQUENCE (SIZE (1..maxNrofMeasId)) OF MeasIdToAddMod

```

```

MeasIdToAddMod ::=
    measId
    measObjectId
    reportConfigId
}

-- TAG-MEASIDTOADDMODLIST-STOP
-- ASN1STOP

```

```

SEQUENCE {
    MeasId,
    MeasObjectId,
    ReportConfigId
}

```

## – *MeasObjectCLI*

The IE *MeasObjectCLI* specifies information applicable for SRS-RSRP measurements and/or CLI-RSSI measurements.

### *MeasObjectCLI* information element

```

-- ASN1START
-- TAG-MEASOBJECTCLI-START

```

```

MeasObjectCLI-r16 ::=
    cli-ResourceConfig-r16
    ...
}

```

```

SEQUENCE {
    CLI-ResourceConfig-r16,

```

```

CLI-ResourceConfig-r16 ::=
    srs-ResourceConfig-r16
    rssi-ResourceConfig-r16
}

```

```

SEQUENCE {
    SetupRelease { SRS-ResourceListConfigCLI-r16 } OPTIONAL, -- Need M
    SetupRelease { RSSI-ResourceListConfigCLI-r16 } OPTIONAL -- Need M
}

```

```

SRS-ResourceListConfigCLI-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-SRS-Resources-r16)) OF SRS-ResourceConfigCLI-r16

```

```

RSSI-ResourceListConfigCLI-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-RSSI-Resources-r16)) OF RSSI-ResourceConfigCLI-r16

```

```

SRS-ResourceConfigCLI-r16 ::=
    srs-Resource-r16
    srs-SCS-r16
    refServCellIndex-r16
    refBWP-r16
    ...
}

```

```

SEQUENCE {
    SRS-Resource,
    SubcarrierSpacing,

| CellsToAddMod field descriptions                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellIndividualOffset</b><br>Cell individual offsets applicable to a specific cell.                                                                                                                                                                                                                                                                         |
| <b>ntn-NeighbourCellInfo</b><br>Includes satellite assistance information of an NTN neighbour cell.                                                                                                                                                                                                                                                           |
| <b>ntn-PolarizationDL</b><br>If present, this parameter indicates polarization information for downlink transmission on service link: including Right hand, Left hand circular polarizations (RHCP, LHCP) and Linear polarization.                                                                                                                            |
| <b>ntn-PolarizationUL</b><br>In this version of the specification, the network does not include this field.                                                                                                                                                                                                                                                   |
| <b>physCellId</b><br>Physical cell identity of a cell in the cell list.                                                                                                                                                                                                                                                                                       |
| <b>referenceLocation</b><br>Reference location of a neighbor NTN Earth-moving cell for the evaluation of the trigger criteria of an associated <i>ReportConfig</i> which contains <i>EventD2</i> or <i>condEventD2</i> . In this release, the network configures at most one moving reference location for <i>eventD2</i> with the same <i>ssbFrequency</i> . |

| <i>MeasObjectNR</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absThreshCSI-RS-Consolidation</i></b><br>Absolute threshold for the consolidation of measurement results per CSI-RS resource(s) from L1 filter(s). The field is used for the derivation of cell measurement results as described in 5.5.3.3 and the reporting of beam measurement information per CSI-RS resource as described in 5.5.5.2.                                                                                                                                                                                                                        |
| <b><i>absThreshSS-BlocksConsolidation</i></b><br>Absolute threshold for the consolidation of measurement results per SS/PBCH block(s) from L1 filter(s). The field is used for the derivation of cell measurement results as described in 5.5.3.3 and the reporting of beam measurement information per SS/PBCH block index as described in 5.5.5.2.                                                                                                                                                                                                                    |
| <b><i>allowedCellsToAddModList</i></b><br>List of cells to add/modify in the allow-list of cells. It applies only to SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>allowedCellsToRemoveList</i></b><br>List of cells to remove from the allow-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>associatedMeasGapSSB</i></b><br>Indicates the associated measurement gap for SSB measuring identified by <i>ssb-ConfigMobility</i> in this measurement object. When multiple <i>MeasObjectNR</i> with the same SSB frequency are configured, the network configures the same measurement gap ID in this field for each <i>MeasObjectNR</i> . If this field is absent, the associated measurement gap is the gap configured via <i>gapFR1</i> , <i>gapFR2</i> , or <i>gapUE</i> .                                                                                  |
| <b><i>associatedMeasGapSSB2</i></b><br>Indicates the associated additional measurement gap for SSB measuring identified by <i>ssb-ConfigMobility</i> in this measurement object for NTN deployments. When multiple <i>MeasObjectNR</i> with the same SSB frequency are configured, the network configures the same measurement gap ID in this field for each <i>MeasObjectNR</i> . If this field is absent, the associated measurement gap is the gap indicated by <i>associatedMeasGapSSB</i> .                                                                        |
| <b><i>associatedMeasGapCSIRS</i></b><br>Indicates the associated measurement gap for CSI-RS measuring identified by <i>csi-rs-ResourceConfigMobility</i> in this measurement object. If this field is absent, the associated measurement gap is the gap configured via <i>gapFR1</i> , <i>gapFR2</i> , or <i>gapUE</i> .                                                                                                                                                                                                                                                |
| <b><i>associatedMeasGapCSIRS2</i></b><br>Indicates the associated additional measurement gap for CSI-RS measuring identified by <i>csi-rs-ResourceConfigMobility</i> in this measurement object for NTN deployments. If this field is absent, the associated measurement gap is the gap indicated by <i>associatedMeasGapCSIRS</i> . In this release of the specification, this field is not configured for NTN deployments.                                                                                                                                            |
| <b><i>cellsToAddModList</i></b><br>List of cells to add/modify in the cell list. If the network includes <i>cellsToAddModListExt-v1710</i> and/or <i>cellsToAddModListExt-v1800</i> , it contains the same number of entries listed in the same order as in <i>cellsToAddModList</i> (i.e without suffix).                                                                                                                                                                                                                                                              |
| <b><i>cellsToRemoveList</i></b><br>List of cells to remove from the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>excludedCellsToAddModList</i></b><br>List of cells to add/modify in the exclude-list of cells. It applies only to SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>excludedCellsToRemoveList</i></b><br>List of cells to remove from the exclude-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>freqBandIndicatorNR</i></b><br>The frequency band in which the SSB and/or CSI-RS indicated in this <i>MeasObjectNR</i> are located and according to which the UE shall perform the RRM measurements. This field is always provided when the network configures measurements with this <i>MeasObjectNR</i> .                                                                                                                                                                                                                                                       |
| <b><i>measCyclePSCell</i></b><br>The parameter is used only when the PSCell is configured on the frequency indicated by the <i>measObjectNR</i> and the SCG is deactivated, see TS 38.133 [14]. The field may also be configured when the PSCell is not configured on that frequency. The network always configures <i>measCyclePSCell</i> for the <i>measObjectNR</i> associated with the PSCell if <i>bfd-and-RLM</i> is set to <i>true</i> and the SCG is deactivated. Value <i>ms160</i> corresponds to 160 ms, value <i>ms256</i> corresponds to 256 ms and so on. |
| <b><i>measCycleSCell</i></b><br>The parameter is used only when an SCell is configured on the frequency indicated by the <i>measObjectNR</i> and is in deactivated state, see TS 38.133 [14]. gNB configures the parameter whenever an SCell is configured on the frequency indicated by the <i>measObjectNR</i> , but the field may also be signalled when an SCell is not configured. Value <i>sf160</i> corresponds to 160 sub-frames, value <i>sf256</i> corresponds to 256 sub-frames and so on.                                                                   |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Indicates the recommended sequence for intra/inter-RAT intra/inter-frequency measurement. Value 1 means the corresponding frequency is measured firstly. Value 2 means the corresponding frequency is measured secondly and so on. If more than one frequency is configured with the same value, it means no recommended sequence among these frequencies. If not provided, it means there is no recommended sequence for the corresponding frequency. This field is only configured for NR standalone or if the <i>measObject</i> is associated to the MCG.                                                                                                                                                                                                             |

| Secondary measurement timing configuration for SS corresponding to this <i>MeasObjectNR</i> with PCI listed in <i>pci-List</i> . For these SS, the periodicity is indicated by <i>periodicity</i> in <i>smtc2</i> and the timing offset is equal to the offset indicated in <i>periodicityAndOffset</i> modulo <i>periodicity</i> . <i>periodicity</i> in <i>smtc2</i> can only be set to a value strictly shorter than the periodicity indicated by <i>periodicityAndOffset</i> in <i>smtc1</i> (e.g. if <i>periodicityAndOffset</i> indicates <i>sf10</i> , <i>periodicity</i> can only be set of <i>sf5</i> , if <i>periodicityAndOffset</i> indicates <i>sf5</i> , <i>smtc2</i> cannot be configured). This field is not configured together with <i>smtc4list</i> . |

| Indicates the frequency of the SS associated to this <i>MeasObjectNR</i> . For operation with shared spectrum channel access, this field is a <i>k</i> *30 kHz shift from the sync raster where <i>k</i> = 0,1,2, and so on if the <i>reportType</i> within the corresponding <i>ReportConfigNR</i> is set to <i>reportCGI</i> (see TS 38.211 [16], clause 7.4.3.1). Frequencies are considered to be on the sync raster if they are also identifiable with a GSCN value (see TS 38.101-1 [15], or TS 38.101-5 [75]).                                                                                                                                                                                                                                                    |

| <b>measDurationSymbols</b><br>Number of consecutive symbols for which the Physical Layer reports samples of RSSI (see TS 38.215 [9], clause 5.1.21). Value <i>sym1</i> corresponds to one symbol, <i>sym14or12</i> corresponds to 14 symbols of the reference numerology for NCP and 12 symbols for ECP, and so on.<br>If <i>measDurationSymbols-v1700</i> is signalled, the UE ignores <i>measDurationSymbols-r16</i> .                                            |
| <b>ref-BWPId</b><br>Indicates the reference BWP for the TCI state indicated in <i>tc-StateInfo</i> . Network includes this field if <i>tc-StateInfo</i> is present. This field is only applicable for operation with shared spectrum channel access in FR2-2 and network does not configure this if the UE does not have any serving cells in FR2-2.                                                                                                                |
| <b>ref-SCS-CP</b><br>Indicates a reference subcarrier spacing and cyclic prefix to be used for RSSI measurements (see TS 38.215 [9]). Value kHz15 corresponds to 15kHz, kHz30 corresponds to 30 kHz, value kHz60-NCP corresponds to 60 kHz using normal cyclic prefix (NCP), and kHz60-ECP corresponds to 60 kHz using extended cyclic prefix (ECP).<br>If <i>ref-SCS-CP-v1700</i> is signalled, the UE ignores <i>ref-SCS-CP-r16</i> .                             |
| <b>ref-ServCellId</b><br>Indicates the FR2-2 reference serving cell index for the TCI state. Network includes this field if <i>tc-StateInfo</i> is present. This field is only applicable for operation with shared spectrum channel access in FR2-2 and network does not configure this if the UE does not have any serving cells in FR2-2.                                                                                                                        |
| <b>rmtc-Bandwidth</b><br>Indicates the bandwidth for the RSSI measurement (see TS 38. 215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                                                                                                      |
| <b>rmtc-Frequency</b><br>Indicates the center frequency of the measured bandwidth for a frequency which operates with shared spectrum channel access (see TS 38. 215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                           |
| <b>rmtc-Periodicity</b><br>Indicates the RSSI measurement timing configuration (RMTC) periodicity (see TS 38.215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                                                                               |
| <b>rmtc-SubframeOffset</b><br>Indicates the RSSI measurement timing configuration (RMTC) subframe offset for this frequency (see TS 38.215 [9], clause 5.1.21). For inter-frequency measurements, this field is optional present and if it is not configured, the UE chooses a random value as <i>rmtc-SubframeOffset</i> for <i>measDurationSymbols</i> which shall be selected to be between 0 and the configured <i>rmtc-Periodicity</i> with equal probability. |
| <b>tc-StateId</b><br>Indicates the TCI state to be used for RSSI measurements. This field is only applicable for shared spectrum channel access in FR2-2. Network does not configure this if the UE does not have any serving cells in FR2-2 and in such a case, it is up to UE implementation how to determine the spatial domain filter for the inter-frequency RSSI measurement in FR2-2.                                                                        |

| SSB-ConfigMobility field descriptions               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>cca-CellsToAddModList, cca-CellsToRemoveList</b> | Lists of cells to be added or removed from the list of neighbor cells that apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>deriveSSB-IndexFromCell</b>                      | If this field is set to <i>true</i> , UE assumes SFN and frame boundary alignment across cells on the same frequency carrier as specified in TS 38.133 [14]. Hence, if the UE is configured with a serving cell for which ( <i>absoluteFrequencySSB</i> , <i>subcarrierSpacing</i> ) in <i>ServingCellConfigCommon</i> is equal to ( <i>ssbFrequency</i> , <i>ssbSubcarrierSpacing</i> ) in this <i>MeasObjectNR</i> , this field indicates whether the UE can utilize the timing of this serving cell to derive the index of SS block transmitted by neighbour cell. Otherwise, this field indicates whether the UE may use the timing of any detected cell on that target frequency to derive the SSB index of all neighbour cells on that frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>deriveSSB-IndexFromCellInter</b>                 | If this field is present, UE assumes SFN and frame boundary alignment between the reference serving cell indicated by <i>ServCellIndex</i> and all neighbour cells in this <i>MeasObjectNR</i> as specified in TS 38.133 [14]. This field also indicates that the UE can utilize the timing of the reference serving cell indicated by <i>ServCellIndex</i> to derive the index of SS block transmitted by all inter-frequency neighbour cells on the frequency indicated by the <i>MeasObjectNR</i> . When this field is included, the network should set <i>deriveSSB-IndexFromCell</i> to <i>true</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ssb-ToMeasure</b>                                | The set of SS blocks to be measured within the SMTC measurement duration. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not to be measured while value 1 indicates that the corresponding SS/PBCH block is to be measured (see TS 38.215 [9]). When the field is not configured the UE measures on all SS blocks. Regardless of the value of this field, SS/PBCH blocks outside of the applicable <i>smtc</i> are not to be measured. See TS 38.215 [9] clause 5.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ssb-ToMeasureAltitudeBasedList</b>               | List of altitude-dependent <i>ssb-ToMeasure</i> . When the UE is within an altitude range indicated by <i>altitudeRange</i> , it ignores the <i>ssb-ToMeasure</i> (without suffix), and applies the corresponding <i>ssb-ToMeasure-r18</i> if present, otherwise (i.e., the UE is within an altitude range indicated by <i>altitudeRange</i> and <i>ssb-ToMeasure-r18</i> is absent) it measures on all SS-blocks. When the UE is outside all the altitude ranges indicated by <i>altitudeRange</i> (if any), <i>ssb-ToMeasure</i> (without suffix) applies.<br>For each altitude range, <i>altitudeMin</i> indicates the minimum altitude in meters relative to sea level, <i>altitudeMax</i> indicates the maximum altitude in meters relative to sea level, and if included, <i>altitudeHyst</i> indicates hysteresis in meters for determination of the altitude range. I.e., when <i>altitudeHyst</i> is configured for an altitude range, the UE considers itself to have entered the range if $altitudeMin \leq \text{UE altitude} \leq altitudeMax$ and after entering the range considers itself to be in the range while $(altitudeMin - altitudeHyst) \leq \text{UE altitude} \leq (altitudeMax + altitudeHyst)$ .<br>For each <i>altitudeRange</i> , if <i>altitudeMin</i> is absent, value <i>minAltitude-r18</i> is used and if <i>altitudeMax</i> is absent, value <i>maxAltitude-r18</i> is used. |
| SSB-PositionQCL-CellsToAddMod field descriptions    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>physCellId</b>                                   | Physical cell identity of a cell in the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ssb-PositionQCL</b>                              | Indicates the QCL relation between SS/PBCH blocks for a specific cell as specified in TS 38.213 [13], clause 4.1. If provided, the cell specific value overwrites the value signalled by <i>ssb-PositionQCL-Common</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Otherwise, it is absent, Need R.                                                                                                                             |

## – *MeasObjectNR-SL*

The IE *MeasObjectNR-SL* concerns a measurement object including a list of transmission resource pool(s) for which CBR measurement is performed for NR sidelink communication/discovery.

### *MeasObjectNR-SL* information element

```
-- ASN1START
-- TAG-MEASOBJECTNR-SL-START

MeasObjectNR-SL-r16 ::= SEQUENCE {
    tx-PoolMeasToRemoveList-r16 Tx-PoolMeasList-r16 OPTIONAL, -- Need N
    tx-PoolMeasToAddModList-r16 Tx-PoolMeasList-r16 OPTIONAL -- Need N
}

MeasObjectNR-SL-r18 ::= SEQUENCE {
    sl-Frequency-r18 INTEGER (1..maxNrofFreqSL-r16),
    tx-PoolMeasToRemoveList-r18 Tx-PoolMeasList-r16 OPTIONAL, -- Need N
    tx-PoolMeasToAddModList-r18 Tx-PoolMeasList-r16 OPTIONAL -- Need N
}

Tx-PoolMeasList-r16 ::= SEQUENCE (SIZE (1..maxNrofSL-PoolToMeasureNR-r16)) OF SL-ResourcePoolID-r16

-- TAG-MEASOBJECTNR-SL-STOP
-- ASN1STOP
```

| MeasObjectNR-SL field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

MeasObjectRxTxDiff

The IE *MeasObjectRxTxDiff* is used to configure the measurement object for UE Rx-Tx time difference measurement.

MeasObjectRxTxDiff information element

```

-- ASN1START
-- TAG-MEASOBJECTRXTXDIFF-START

MeasObjectRxTxDiff-r17 ::= SEQUENCE {
    dl-Ref-r17 CHOICE {
        prs-Ref-r17 NULL,
        csi-RS-Ref-r17 NULL,
        ...
    } OPTIONAL, -- Need R
    ...
}

-- TAG-MEASOBJECTRXTXDIFF-STOP
-- ASN1STOP
    
```

MeasObjectRxTxDiff field descriptions

dl-Ref

configures the DL references signals to measure Rx-Tx time difference. *prs-Ref-r17* indicates PRS is chosen, and *csi-RS-Ref-r17* indicates that CSI-RS for tracking is chosen. Only one PRS resource set is configured by the network. Only one *NZP-CSI-RS-ResourceSet* can be configured with *pdcc-Info-r17* set to *true* and it is used for UE Rx-Tx time difference measurement. Only reference signals from the PCell of the MCG can be configured by the network.

| MeasObjectUTRA-FDD field descriptions                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierFreq</b><br>Identifies UTRA-FDD carrier frequency for which this configuration is valid. NR does not configure more than one measurement object for the same physical frequency regardless of the ARFCN used to indicate this. |
| <b>cellIndexUTRA-FDD</b><br>Entry index in the neighbouring cell list.                                                                                                                                                                   |
| <b>cellsToAddModList</b><br>List of UTRA-FDD cells to add/modify in the neighbouring cell list.                                                                                                                                          |
| <b>cellsToRemoveList</b><br>List of cells to remove from the neighbouring cell list.                                                                                                                                                     |
| <b>utra-FDD-Q-OffsetRange</b><br>Used to indicate a frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value is in dB.                                                         |

–
 **MeasResultCellListSFTD-NR**

The IE *MeasResultCellListSFTD-NR* consists of SFN and radio frame boundary difference between the PCell and an NR cell as specified in TS 38.215 [9] and TS 38.133 [14].

**MeasResultCellListSFTD-NR information element**

```

-- ASN1START
-- TAG-MEASRESULTCELLLISTSFTD-NR-START

MeasResultCellListSFTD-NR ::=
    SEQUENCE (SIZE (1..maxCellsFTD)) OF MeasResultCellSFTD-NR

MeasResultCellSFTD-NR ::=
    SEQUENCE {
        physCellId          PhysCellId,
        sfn-OffsetResult     INTEGER (0..1023),
        frameBoundaryOffsetResult  INTEGER (-30720..30719),
        rsrp-Result          RSRP-Range
    }
-- TAG-MEASRESULTCELLLISTSFTD-NR-STOP
-- ASN1STOP
    
```

| MeasResultCellSFTD-NR field descriptions                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sfn-OffsetResult</b><br>Indicates the SFN difference between the PCell and the NR cell as an integer value according to TS 38.215 [9].                     |
| <b>frameBoundaryOffsetResult</b><br>Indicates the frame boundary difference between the PCell and the NR cell as an integer value according to TS 38.215 [9]. |

–
 **MeasResultCellListSFTD-EUTRA**

The IE *MeasResultCellListSFTD-EUTRA* consists of SFN and radio frame boundary difference between the PCell and an E-UTRA PSCell.

MeasResultCellListSFTD-EUTRA information element

```
-- ASN1START
-- TAG-MEASRESULTCELLLISTSFTD-EUTRA-START

MeasResultCellListSFTD-EUTRA ::=
    SEQUENCE (SIZE (1..maxCellsSFTD)) OF MeasResultSFTD-EUTRA

MeasResultSFTD-EUTRA ::=
    SEQUENCE {
        eutra-PhysCellId      EUTRA-PhysCellId,
        sfn-OffsetResult      INTEGER (0..1023),
        frameBoundaryOffsetResult  INTEGER (-30720..30719),
        rsrp-Result           RSRP-Range
    }

-- TAG-MEASRESULTCELLLISTSFTD-EUTRA-STOP
-- ASN1STOP
```

| MeasResultSFTD-EUTRA field descriptions                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>eutra-PhysCellId</b><br>Identifies the physical cell identity of the E-UTRA cell for which the reporting is being performed.                                   |
| <b>sfn-OffsetResult</b><br>Indicates the SFN difference between the PCell and the E-UTRA cell as an integer value according to TS 38.215 [9].                     |
| <b>frameBoundaryOffsetResult</b><br>Indicates the frame boundary difference between the PCell and the E-UTRA cell as an integer value according to TS 38.215 [9]. |

MeasResults

The IE *MeasResults* covers measured results for intra-frequency, inter-frequency, inter-RAT mobility and measured results for NR sidelink communication/discovery/positioning.

— **MeasSequence**

The IE *MeasSequence* is used to configure a recommended sequence for intra/inter-RAT intra/inter-frequency measurement.

**MeasSequence information element**

```
-- ASN1START
-- TAG-MEASSEQUENCE-START
```

```
MeasSequence-r18 ::= INTEGER (1..maxMeasSequence-r18)
```

```
-- TAG-MEASSEQUENCE-STOP
-- ASN1STOP
```

## — *MeasTriggerQuantityEUTRA*

The IE *MeasTriggerQuantityEUTRA* is used to configure the trigger quantity and reporting range for E-UTRA measurements. The RSRP, RSRQ and SINR ranges correspond to *RSRP-Range*, *RSRQ-Range* and *RS-SINR-Range* in TS 36.331 [10], respectively.

### *MeasTriggerQuantityEUTRA* information element

```
-- ASN1START
-- TAG-MEASTRIGGERQUANTITYEUTRA-START
```

```
MeasTriggerQuantityEUTRA ::= CHOICE {
    rsrp          RSRP-RangeEUTRA,
    rsrq          RSRQ-RangeEUTRA,
    sinr          SINR-RangeEUTRA
}
```

```
RSRP-RangeEUTRA ::= INTEGER (0..97)
```

```
RSRQ-RangeEUTRA ::= INTEGER (0..34)
```

```
SINR-RangeEUTRA ::= INTEGER (0..127)
```

```
-- TAG-MEASTRIGGERQUANTITYEUTRA-STOP
-- ASN1STOP
```

## — *MeasurementValidityDuration*

The IE *MeasurementValidityDuration* indicates time values for validation of reported idle/inactive and reselection measurements as defined in TS 38.133[14]. Value s5 corresponds to 5 seconds, value s10 corresponds to 10 seconds and so on.

### *MeasurementValidityDuration* information element

```
-- ASN1START
-- TAG-MEASUREMENTVALIDITYDURATION-START
```

```
MeasurementValidityDuration-r18 ::= ENUMERATED {s5, s10, s20, s50, s100, spare3, spare2, spare1}
```

```
-- TAG-MEASUREMENTVALIDITYDURATION-STOP
-- ASN1STOP
```

—
MeasWindowConfig

The IE *MeasWindowConfig* specifies the effective measurement window configuration for inter-RAT E-UTRA measurement.

MeasWindowConfig information element

```

-- ASN1START
-- TAG-MEASWINDOWCONFIG-START

MeasWindowConfig-r18 ::= SEQUENCE {
    windowOffsetPeriodicity-r18 CHOICE {
        periodicityMs40-r18 INTEGER (0..39),
        periodicityMs80-r18 INTEGER (0..79),
        ...
    },
    windowDuration-r18 ENUMERATED {ms2, ms5, ms5dot5, spare1},
    ...
}

-- TAG-MEASWINDOWCONFIG-STOP
-- ASN1STOP

```

| MeasWindowConfig field descriptions                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>windowDuration</b><br>Value windowDuration is the measurement window length in ms of effective measurement window. Value <i>ms2</i> corresponds to 2 ms, value <i>ms5</i> corresponds to 5 ms, and Value <i>ms5dot5</i> corresponds to 5.5 ms.   |
| <b>windowOffsetPeriodicity</b><br>Indicates the periodicity and offset of effective measurement window. The choice determines the periodicity (periodicityMs40 for 40ms and periodicityMs80 for 80 ms). The field value indicates the offset in ms. |

—
MobilityStateParameters

The IE *MobilityStateParameters* contains parameters to determine UE mobility state.

MobilityStateParameters information element

```

-- ASN1START
-- TAG-MOBILITYSTATEPARAMETERS-START

MobilityStateParameters ::= SEQUENCE{
    t-Evaluation ENUMERATED {
        s30, s60, s120, s180, s240, spare3, spare2, spare1},
    t-HystNormal ENUMERATED {
        s30, s60, s120, s180, s240, spare3, spare2, spare1},
    n-CellChangeMedium INTEGER (1..16),
    n-CellChangeHigh INTEGER (1..16)
}

```

-- TAG-MOBILITYSTATEPARAMETERS-STOP  
-- ASN1STOP

| MobilityStateParameters field descriptions                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>n-CellChangeHigh</b><br>The number of cell changes to enter high mobility state. Corresponds to N <sub>CR_H</sub> in TS 38.304 [20].                                                                                          |
| <b>n-CellChangeMedium</b><br>The number of cell changes to enter medium mobility state. Corresponds to N <sub>CR_M</sub> in TS 38.304 [20].                                                                                      |
| <b>t-Evaluation</b><br>The duration for evaluating criteria to enter mobility states. Corresponds to T <sub>CRmax</sub> in TS 38.304 [20]. Value in seconds, s30 corresponds to 30 s and so on.                                  |
| <b>t-HystNormal</b><br>The additional duration for evaluating criteria to enter normal mobility state. Corresponds to T <sub>CRmaxHyst</sub> in TS 38.304 [20]. Value in seconds, value s30 corresponds to 30 seconds and so on. |

— MRB-Identity

The IE *MRB-Identity* is used to identify a multicast MRB used by a UE.

MRB-Identity information element

-- ASN1START  
-- TAG-MRB-IDENTITY-START  
  
MRB-Identity-r17 ::= **INTEGER** (1..512)  
  
-- TAG-MRB-IDENTITY-STOP  
-- ASN1STOP

— MsgA-ConfigCommon

The IE *MsgA-ConfigCommon* is used to configure the PRACH and PUSCH resource for transmission of MsgA in 2-step random access type procedure.

-- ASN1START  
-- TAG-MSGACONFIGCOMMON-START  
  
MsgA-ConfigCommon-r16 ::= **SEQUENCE** {  
    rach-ConfigCommonTwoStepRA-r16 RACH-ConfigCommonTwoStepRA-r16,

If the field is absent, the UE shall use the parameter <i>msgA-PUSCH-TimeDomainAllocation</i> (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>msgA-Alpha</i></b><br>Dedicated alpha value for MsgA PUSCH. If the field is absent, the UE shall use the value of <i>msg3-Alpha</i> if configured, else UE applies value 1 (see TS 38.213 [13], clause 7.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>msgA-DMRS-Config</i></b><br>DMRS configuration for msgA PUSCH (see TS 38.213 [13], clause 8.1A and TS 38.214 [19] clause 6.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>msgA-HoppingBits</i></b><br>Value of hopping bits to indicate which frequency offset to be used for second hop. See Table 8.3-1 in TS 38.213 [13].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>msgA-IntraSlotFrequencyHopping</i></b><br>Intra-slot frequency hopping per PUSCH occasion (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>msgA-MCS</i></b><br>Indicates the MCS index for msgA PUSCH from the Table 6.1.4.1-1 for DFT-s-OFDM and Table 5.1.3.1-1 for CP-OFDM in TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>msgA-PUSCH-TimeDomainAllocation</i></b><br>Indicates a combination of start symbol and length and PUSCH mapping type from the TDRA table ( <i>PUSCH-TimeDomainResourceAllocationList</i> if provided in <i>PUSCH-ConfigCommon</i> , or else the default Table 6.1.2.1.1-2 in 38.214 [19] is used if <i>pusch-TimeDomainAllocationList</i> is not provided in <i>PUSCH-ConfigCommon</i> ). The parameter K2 in the table is not used for msgA PUSCH. The network configures one of <i>msgA-PUSCH-TimeDomainAllocation</i> and <i>startSymbolAndLengthMsgA-PO</i> , but not both. If the field is absent, the UE shall use the value of <i>startSymbolAndLengthMsgA-PO</i> . |
| <b><i>msgA-PUSCH-TimeDomainOffset</i></b><br>A single time offset with respect to the start of each PRACH slot (with at least one valid RO), counted as the number of slots (based on the numerology of active UL BWP). See TS 38.213 [13], clause 8.1A.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>nrofDMRS-Sequences</i></b><br>Number of DMRS sequences for MsgA PUSCH for CP-OFDM. In case of single PUSCH configuration or if the DMRS symbols of multiple configurations are not overlapped, if the DMRS resources configured in one PUSCH occasion is no larger than 8 (for <i>len2</i> ) or 4 (for <i>len1</i> ), then only DMRS port is configured.                                                                                                                                                                                                                                                                                                                   |
| <b><i>nrofInterlacesPerMsgA-PO</i></b><br>Number of consecutive interlaces per PUSCH occasion if interlaced PUSCH is configured. For 30kHz SCS only the integers 1, 2, 3, 4, 5 are applicable (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>nrofMsgA-PO-FDM</i></b><br>The number of msgA PUSCH occasions FDMed in one time instance (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>nrofMsgA-PO-PerSlot</i></b><br>Number of time domain PUSCH occasions in each slot. PUSCH occasions including guard period are contiguous in time domain within a slot (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>nrofPRBs-PerMsgA-PO</i></b><br>Number of PRBs per PUSCH occasion (see TS 38.213 [13], clause 8.1A). An eRedcap UE ignores the PRACH and PUSCH resource parameters for transmission of MsgA in 2-step random access type procedure if configured number of PRBs per PUSCH occasion for Preambles group A is larger than the maximum number of PRBs that can be configured per slot or per hop. If configured number of PRBs per PUSCH occasion for Preambles group B is larger than the maximum number of PRBs that can be configured per slot or per hop, an eRedCap UE ignores the PRACH and PUSCH resource parameters for transmission of MsgA using Preambles group B.  |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>nrofSlotsMsgA-PUSCH</i></b><br>Number of slots (in active UL BWP numerology) containing one or multiple PUSCH occasions, each slot has the same time domain resource allocation (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>startSymbolAndLengthMsgA-PO</i></b><br>An index giving valid combinations of start symbol, length and mapping type as start and length indicator (SLIV) for the first msgA PUSCH occasion, for RRC_CONNECTED UEs in non-initial BWP as described in TS 38.214 [19] clause 6.1.2. The network configures the field so that the allocation does not cross the slot boundary. The number of occupied symbols excludes the guard period. If the field is absent, the UE shall use the value in <i>msgA-PUSCH-TimeDomainAllocation</i> (see TS 38.213 [13], clause 8.1A). The network configures one of <i>msgA-PUSCH-TimeDomainAllocation</i> and <i>startSymbolAndLengthMsgA-PO</i> , but not both. If the field is absent, the UE shall use the value of <i>msgA-PUSCH-TimeDomainAllocation</i> . |

| <b><i>MsgA-DMRS-Config</i> field descriptions</b>                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>msgA-DMRS-AdditionalPosition</i></b><br>Indicates the position for additional DM-RS. If the field is absent, the UE applies value <i>pos2</i> .                                                    |
| <b><i>msgA-MaxLength</i></b><br>indicates single-symbol or double-symbol DMRS. If the field is absent, the UE applies value <i>len1</i> .                                                                |
| <b><i>msgA-PUSCH-DMRS-CDM-Group</i></b><br>1-bit indication of indices of CDM group(s). If the field is absent, then both CDM groups are used.                                                           |
| <b><i>msgA-PUSCH-NrofPorts</i></b><br>0 indicates 1 port per CDM group, 1 indicates 2 ports per CDM group. If the field is absent then 4 ports per CDM group are used (see TS 38.213 [13], clause 8.1A). |
| <b><i>msgA-ScramblingID0</i></b><br>UL DMRS scrambling initialization for CP-OFDM. If the field is absent the UE applies the value Physical cell ID ( <i>physCellID</i> ).                               |
| <b><i>msgA-ScramblingID1</i></b><br>UL DMRS scrambling initialization for CP-OFDM. If the field is absent the UE applies the value Physical cell ID ( <i>physCellID</i> ).                               |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                                                                                                                                                                               |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FreqHopConfigured</i>    | This field is mandatory present when the field <i>msgA-IntraSlotFrequencyHopping</i> is configured. Otherwise, the field is absent.                                                                                                                                                                              |
| <i>GroupBConfigured</i>     | The field is mandatory present if <i>groupB-ConfiguredTwoStepRA</i> is configured in <i>RACH-ConfigCommonTwoStepRA</i> , otherwise the field is absent.                                                                                                                                                          |
| <i>InitialBWPCongig</i>     | The field is mandatory present when <i>MsgA-ConfigCommon</i> is configured for the initial uplink BWP, or when <i>MsgA-ConfigCommon</i> is configured for a non-initial uplink BWP and <i>MsgA-ConfigCommon</i> is not configured for the initial uplink BWP, otherwise the field is optionally present, Need S. |

## – MultiFrequencyBandListNR

The IE *MultiFrequencyBandListNR* is used to configure a list of one or multiple NR frequency bands.

### ***MultiFrequencyBandListNR* information element**

```
-- ASN1START
-- TAG-MULTIFREQUENCYBANDLISTNR-START
```

```
MultiFrequencyBandListNR ::= SEQUENCE (SIZE (1..maxNrofMultiBands)) OF FreqBandIndicatorNR
```

```
-- TAG-MULTIFREQUENCYBANDLISTNR-STOP
-- ASN1STOP
```

## — *MultiFrequencyBandListNR-SIB*

The IE *MultiFrequencyBandListNR-SIB* indicates the list of frequency bands, for which cell (re-)selection parameters are common, and a list of *additionalPmax* and *additionalSpectrumEmission*.

### *MultiFrequencyBandListNR-SIB* information element

```
-- ASN1START
-- TAG-MULTIFREQUENCYBANDLISTNR-SIB-START

MultiFrequencyBandListNR-SIB ::=          SEQUENCE (SIZE (1.. maxNrofMultiBands)) OF NR-MultiBandInfo

NR-MultiBandInfo ::=                     SEQUENCE {
    freqBandIndicatorNR                    OPTIONAL,    -- Cond OptULNotSIB2

| <b><i>freqBandIndicatorNR</i></b>          | Provides an NR frequency band number as defined in TS 38.101-1 [15], TS 38.101-2 [39], table 5.2-1, and TS 38.101-5 [75], table 5.2.2-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>freqBandIndicatorNR-Aerial</i></b>   | Provides an NR frequency band number for aerial UE(s), as defined in TS 38.101-1 [15], TS 38.101-2 [39], table 5.2-1, and TS 38.101-5 [75], table 5.2.2-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>nr-NS-PmaxList</i></b>               | Provides a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values. If the field is absent the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15] table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). This field is ignored by IAB-MT and wide area NCR-MT (see TS 38.106 [79]). The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The wide area NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79]. If <i>nr-NS-PmaxList-v1760</i> is present, it shall contain the same number of entries, listed in the same order as in <i>nr-NS-PmaxList</i> (without suffix).                                                                                                                                                                                                                             |
| <b><i>nr-NS-PmaxListAerial</i></b>         | Provides a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values for aerial UE(s) as defined in TS 38.101-1 [15], clause 6.2K. If the field is absent, the value indicated by the corresponding field within <i>frequencyBandList</i> for the same NR frequency band number applies, if present. Otherwise (i.e. the field is not present for the same NR frequency band number in any of the <i>nr-NS-PmaxList</i> , <i>nr-NS-PmaxList-v1760</i> or <i>nr-NS-PmaxListAerial</i> ), the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15] table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). This field is ignored by IAB-MT and wide area NCR-MT (see TS 38.106 [79]). The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The wide area NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79]. |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OptULNotSIB2</i>  | The field is absent for <i>SIB2</i> and is mandatory present if the parent IE is included in <i>SIB4</i> or <i>frequencyInfoDL-SIB</i> . Otherwise, if the field is absent in <i>frequencyInfoUL-SIB</i> in <i>UplinkConfigCommonSIB</i> , the UE will use the frequency band indicated in <i>frequencyInfoDL-SIB</i> in <i>DownlinkConfigCommonSIB</i> . |

## – *MUSIM-GapConfig*

The IE *MUSIM-GapConfig* specifies the MUSIM gap configuration and controls setup/release of MUSIM gaps.

| MUSIM-GapConfig field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>musim-AperiodicGap</b><br>Indicates the MUSIM aperiodic gap as specified in TS 38.133 [14] clause 9.1.10. If UE indicates the <i>musim-Starting-SFN-AndSubframe</i> when requesting aperiodic gap the network can only configure the aperiodic gap with the same start point or no aperiodic gap. If the field <i>musim-Starting-SFN-AndSubframe</i> is absent for aperiodic gap, network can configure any timing as the starting point for aperiodic gap or configure no aperiodic gap. |
| <b>musim-GapInfo</b><br>Indicates the values for <i>musim-GapLength</i> and <i>musim-GapRepetitionAndOffset</i> . When network provides periodic gap, network always signals the <i>musim-GapLength</i> and <i>musim-GapRepetitionAndOffset</i> as indicated by the UE's preferred MUSIM gap configuration.                                                                                                                                                                                  |
| <b>musim-GapKeep</b><br>Indicates the UE is allowed to use "keep solution" for colliding MUSIM periodic/aperiodic gaps. If "keep solution" is not granted, collisions between MUSIM periodic gaps are resolved based on the assigned MUSIM gap priorities as specified in TS 38.133[14].                                                                                                                                                                                                     |
| <b>musim-GapToAddModListExt</b><br>Indicates the priority of MUSIM periodic gap(s).<br>If the network includes <i>musim-GapToAddModListExt-v1820</i> , it includes the same number of entries, and listed in the same order, as in <i>musim-GapToAddModList-r17</i> .<br>For the priority of MUSIM aperiodic gap, the MUSIM aperiodic gap is always kept (not dropped) from UE perspective in case of collisions with other gaps (i.e. all gaps including MUSIM gaps, etc).                  |
| <b>musim-GapToAddModList</b><br>List of MUSIM periodic gap patterns to add or modify.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>musim-GapToReleaseList</b><br>List of MUSIM periodic gap patterns to release.                                                                                                                                                                                                                                                                                                                                                                                                             |

— MUSIM-GapId

The IE *MUSIM-GapId* is used to identify UE periodic MUSIM gap(s) to add, modify or release.

| <b>servCellId</b><br>Indicates the serving cell which contains the target SSB (associated with the initial DL BWP) to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>gapIndicationIntra</b><br>Indicates whether measurement gap is required for the UE to perform intra-frequency SSB based measurements on the concerned serving cell. Value <i>gap</i> indicates that a measurement gap is needed if any of the UE configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB) do not contain the frequency domain resources of the SSB associated to the initial DL BWP (CD-SSB). Value <i>no-gap</i> indicates a measurement gap is not needed to measure the SSB associated to the initial DL BWP (CD-SSB) for all configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB), no matter the SSB is within the configured BWP or not. This field shall be set to 'no-gap' for the serving cell(s) belonging to the corresponding band(s) where <i>bwpOperationMeasWithoutInterrupt-r18</i> is supported by the UE. |

| NeedForGapsNR field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bandNR</b><br>Indicates the NR target band to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>gapIndication</b><br>Indicates whether measurement gap is required for the UE to perform SSB based measurements on the concerned NR target band while NR-DC or NE-DC is not configured. The UE determines this information based on the resultant configuration of the <i>RRCReconfiguration</i> or <i>RRCResume</i> message that triggers this response. Value <i>gap</i> indicates that a measurement gap is needed, value <i>no-gap</i> indicates a measurement gap is not needed. |

– **NeedForGapNCSG-ConfigEUTRA**

The IE *NeedForGapNCSG-ConfigEUTRA* contains configuration related to the reporting of measurement gap and NCSG requirement information.

NeedForGapNCSG-ConfigEUTRA information element

```
-- ASN1START
-- TAG-NeedForGapNCSG-ConfigEUTRA-START

NeedForGapNCSG-ConfigEUTRA-r17 ::= SEQUENCE {
    requestedTargetBandFilterNCSG-EUTRA-r17 SEQUENCE (SIZE (1..maxBandsEUTRA)) OF FreqBandIndicatorEUTRA OPTIONAL -- Need R
}

| <b><i>servCellId</i></b><br>Indicates the serving cell which contains the target SSB (associated with the initial DL BWP) to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>gapIndicationIntra</i></b><br>Indicates whether measurement gap or NCSG is required for the UE to perform intra-frequency SSB based measurements on the concerned serving cell. Value <i>gap</i> indicates that a measurement gap is needed if any of the UE configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB) do not contain the frequency domain resources of the SSB associated to the initial DL BWP (CD-SSB). Value <i>ncsg</i> indicates that a NCSG is needed if any of the UE configured BWPs do not contain the frequency domain resources of the SSB associated to the initial DL BWP. Value <i>nogap-noncsg</i> indicates that neither a measurement gap nor a NCSG is needed to measure the SSB associated to the initial DL BWP (CD-SSB) for all configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB), no matter the SSB is within the configured BWP or not. This field shall be set to ' <i>nogap-noncsg</i> ' for the serving cell cell(s) belonging to the corresponding band(s) where <i>bwpOperationMeasWithoutInterrupt-r18</i> is supported by the UE. Value <i>nogap-noncsg</i> also indicates interruption is not needed. |

| <i>NeedForNCSG-NR field descriptions</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bandNR</i></b><br>Indicates the NR target band to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>gapIndication</i></b><br>Indicates whether measurement gap or NCSG is required for the UE to perform SSB based measurements on the concerned NR target band while NR-DC or NE-DC is not configured. The UE determines this information based on the resultant configuration of the <i>RRCReconfiguration</i> or <i>RRCResume</i> message that triggers this response. Value <i>gap</i> indicates that a measurement gap is needed, value <i>ncsg</i> indicates that a NCSG is needed, and value <i>nogap-noncsg</i> indicates neither a measurement gap nor a NCSG is needed. Value <i>nogap-noncsg</i> also indicates interruption is not needed. |

— *NeedForInterruptionInfoNR*

The IE *NeedForInterruptionInfoNR* indicates whether interruption is needed for the UE to perform SSB based measurements on an NR target band without measurement gap while NR-DC or NE-DC is not configured.

— *NextHopChainingCount*

The IE *NextHopChainingCount* is used to update the K<sub>gNB</sub> key and corresponds to parameter NCC: See TS 33.501 [11].

***NextHopChainingCount* information element**

```
-- ASN1START
-- TAG-NEXTHOPCHAININGCOUNT-START
```

```
NextHopChainingCount ::= INTEGER (0..7)
```

```
-- TAG-NEXTHOPCHAININGCOUNT-STOP
-- ASN1STOP
```

**— *NG-5G-S-TMSI***

The IE *NG-5G-S-TMSI* contains a 5G S-Temporary Mobile Subscription Identifier (5G-S-TMSI), a temporary UE identity provided by the 5GC which uniquely identifies the UE within the tracking area, see TS 23.003 [21].

***NG-5G-S-TMSI* information element**

```
-- ASN1START
-- TAG-NG-5G-S-TMSI-START
```

```
NG-5G-S-TMSI ::= BIT STRING (SIZE (48))
```

```
-- TAG-NG-5G-S-TMSI-STOP
-- ASN1STOP
```

**— *NonCellDefiningSSB***

The IE *NonCellDefiningSSB* is used to configure a NCD-SSB to be used while the UE operates in an RedCap-specific initial BWP that does not contain the CD-SSB or a dedicated BWP that does not contain the CD-SSB.

***NonCellDefiningSSB* information element**

```
-- ASN1START
-- TAG-NONCELLDEFININGSSB-START
```

```
NonCellDefiningSSB-r17 ::= SEQUENCE {
    absoluteFrequencySSB-r17 ARFCN-ValueNR,
    ssb-Periodicity-r17 ENUMERATED { ms5, ms10, ms20, ms40, ms80, ms160, spare2, spare1 } OPTIONAL, -- Need S
    ssb-TimeOffset-r17 ENUMERATED { ms5, ms10, ms15, ms20, ms40, ms80, spare2, spare1 } OPTIONAL, -- Need S
    ...
}
```

```
-- TAG-NONCELLDEFININGSSB-STOP
-- ASN1STOP
```

**NonCellDefiningSSB field descriptions*****absoluteFrequencySSB***

Frequency of the NCD-SSB. The network configures this field so that the SSB is within the bandwidth of the BWP configured in *BWP-DownlinkCommon*.

***ssb-Periodicity***

The periodicity of this NCD-SSB. The network configures only periodicities that are larger than the periodicity of serving cell's CD-SSB. If the field is absent, the UE applies the SSB periodicity of the CD-SSB (*ssb-periodicityServingCell* configured in *ServingCellConfigCommon* or *ServingCellConfigCommonSIB*).

***ssb-TimeOffset***

The time offset between CD-SSB of the serving cell and this NCD-SSB. Value *ms5* means the first burst of NCD-SSB is transmitted 5ms later than the first burst of CD-SSB transmitted after the first symbol of SFN=0 of the serving cell, value *ms10* means the first burst of NCD-SSB is transmitted 10ms later than the first burst of CD-SSB transmitted after the first symbol in SFN=0 of the serving cell, and so on. If the field is absent, UE considers that the time offset between the first burst of CD-SSB transmitted in the serving cell and the first burst of this NCD-SSB transmitted is zero. For UEs in TDD cells, the network configures this time offset to be an integer multiple of the periodicity of the serving cell's CD-SSB.

— ***NPN-Identity***

The IE *NPN-Identity* includes either a list of CAG-IDs or a list of NIDs per PLMN Identity. Further information regarding how to set the IE is specified in TS 23.003 [21].

***NPN-Identity* information element**

| <i>NPN-IdentityInfoList</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>iab-Support</i></b><br>This field combines both the support of IAB and the cell status for IAB. If the field is present, the cell supports IAB and the cell is also considered as a candidate for cell (re)selection for IAB-nodes; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. |
| <b><i>gNB-ID-Length</i></b><br>Indicates the length of the gNB ID out of the 36-bit long <i>cellIdentity</i> . This field is always present if the <i>mobileIAB-Support</i> is broadcasted.                                                                                                                                                                                                                       |
| <b><i>mobileIAB-Support</i></b><br>This field indicates the support of mobile IAB and whether the cell can be considered as a candidate for cell (re)selection for mobile IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. If the field is absent, the cell is barred for mobile IAB-node.                                                                                     |
| <b><i>NPN-IdentityInfo</i></b><br>The <i>NPN-IdentityInfo</i> contains one or more NPN identities and additional information associated with those NPNs. Only the same type of NPNs (either SNPNs or PNI-NPNs) can be listed in a <i>NPN-IdentityInfo</i> element.                                                                                                                                                |
| <b><i>nnp-IdentityList</i></b><br>The <i>nnp-IdentityList</i> contains one or more NPN Identity elements.                                                                                                                                                                                                                                                                                                         |
| <b><i>trackingAreaCode</i></b><br>Indicates the Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                                                                                                                                                              |
| <b><i>ranac</i></b><br>Indicates the RAN Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                                                                                                                                                                              |
| <b><i>cellReservedForOperatorUse</i></b><br>Indicates whether the cell is reserved for operator use (for the NPN(s) identified in the <i>nnp-IdentityList</i> ) as defined in TS 38.304 [20]. This field is ignored by NPN capable IAB-MT and NPN capable NCR-MT.                                                                                                                                                 |

## – NR-DL-PRS-PDC-Info

The IE *NR-DL-PRS-PDC-Info* defines downlink PRS configuration for PDC.

#### NR-DL-PRS-PDC-ResourceSet field descriptions

##### **dl-PRS-ResourceBandwidth**

This field specifies the number of PRBs allocated for all the DL-PRS Resource (allocated DL-PRS bandwidth) in multiples of 4 PRBs in this resource set. All DL-PRS Resources of the DL-PRS-PDC Resource Set have the same bandwidth. Integer value 1 corresponds to 24 PRBs, value 2 corresponds to 28 PRBs, value 3 corresponds to 32 PRBs and so on.

##### **dl-PRS-StartPRB**

This field specifies the start PRB index defined as offset with respect to subcarrier 0 in common resource block 0 for the DL-PRS Resource. All DL-PRS Resources of the DL-PRS-PDC Resource Set have the same value of dl-PRS-StartPRB.

##### **numSymbols**

This field specifies the number of symbols per DL-PRS Resource within a slot. The UE does not expect to be configured for PDC with a PRS with *numSymbols* equals to n1 unless an SSB index is provided as a *typeC* or *typeC-plus-typeD* QCL source, or another PRS resource with *numSymbols* more than n1 is provided as QCL source.

##### **periodicityAndOffset**

This field specifies the periodicity of DL-PRS allocation in slots and the slot offset with respect to SFN #0 slot #0 in the PCell where the DL-PRS-PDC Resource Set is configured (i.e., slot where the first DL-PRS Resource of DL-PRS-PDC Resource Set occurs).

##### **repFactorAndTimeGap**

If this field is absent, the value for *repetitionFactor* is 1 (i.e., no resource repetition).

#### RepFactorAndTimeGap field descriptions

##### **repetitionFactor**

This field specifies how many times each DL-PRS Resource is repeated for a single instance of the DL-PRS Resource Set. It is applied to all resources of the DL-PRS Resource Set. Enumerated values n2, n4, n6, n8, n16, n32 correspond to 2, 4, 6, 8, 16, 32 resource repetitions, respectively.

##### **timeGap**

This field specifies the offset in units of slots between two repeated instances of a DL-PRS Resource corresponding to the same DL-PRS Resource ID within a single instance of the DL-PRS Resource Set. The time duration spanned by one DL-PRS Resource Set containing repeated DL-PRS Resources should not exceed the periodicity configured by *periodicityAndOffset*.

**NR-DL-PRS-Resource field description*****dl-PRS-ResourceSymbolOffset***

This field specifies the starting symbol of the *DL-PRS Resource* within a slot. If *dl-PRS-ResourceSymbolOffset-v1800* is present, the UE shall ignore *dl-PRS-ResourceSymbolOffset-r17*.

— **NR-NS-PmaxList**

The IE *NR-NS-PmaxList* is used to configure a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 38.101-1 [15], table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A for a given frequency band.

**NR-NS-PmaxList information element**

```
-- ASN1START
-- TAG-NR-NS-PMAXLIST-START

NR-NS-PmaxList ::=                               SEQUENCE (SIZE (1..maxNR-NS-Pmax)) OF NR-NS-PmaxValue
NR-NS-PmaxValue ::=                             SEQUENCE {
    additionalPmax                               P-Max                               OPTIONAL,    -- Need N

| <b>NTN-Config field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>ephemerisInfo</i></b><br/>This field provides satellite ephemeris either in format of position and velocity state vector or in format of orbital parameters. This field is excluded when determining changes in system information, i.e. changes to <i>ephemerisInfo</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>epochTime</i></b><br/>If this field is absent for the NTN serving cell, the epoch time is the end of SI window where this <i>SIB19</i> is scheduled. This field is mandatory present when <i>ntn-Config</i> is provided in dedicated configuration. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> or <i>SatSwitchWithReSync</i> in an NTN cell, the UE uses epoch time of the serving cell, otherwise the field is based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated in this field refers to the SFN and sub-frame of the serving cell. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> in a TN cell, the epoch time is the end of SI window where this <i>SIB19</i> is scheduled. In case of satellite switch with resynchronization, this field is based on the timing of the cell served by the source satellite. This field is excluded when determining changes in system information, i.e. changes to <i>epochTime</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>.</p>                                                                                                                                 |
| <p><b><i>cellSpecificKoffset</i></b><br/>Scheduling offset used for the timing relationships that are modified for NTN (see TS 38.213 [13]). The unit of the field <i>K_offset</i> is number of slots for a given subcarrier spacing of 15 kHz. If the field is absent UE assumes value 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>kmac</i></b><br/>Scheduling offset provided by network if downlink and uplink frame timing are not aligned at gNB. If the field is absent UE assumes value 0. The unit of <i>kmac</i> is number of slots for a given subcarrier spacing of 15 kHz.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>ntn-PolarizationDL</i></b><br/>If present, this parameter indicates polarization information for downlink transmission on service link: including Right hand, Left hand circular polarizations (RHCP, LHCP) and Linear polarization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b><i>ntn-PolarizationUL</i></b><br/>If present, this parameter indicates Polarization information for uplink service link.<br/>If not present and <i>ntn-PolarizationDL</i> is present, UE assumes the same polarization for UL and DL. If both <i>ntn-PolarizationUL</i> and <i>ntn-PolarizationDL</i> are not present, the UE releases any stored value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b><i>ntn-UISyncValidityDuration</i></b><br/>A validity duration configured by the network for assistance information (i.e. Serving and/or neighbour satellite ephemeris and Common TA parameters) which indicates the maximum time duration (from <i>epochTime</i>) during which the UE can apply assistance information without having acquired new assistance information.<br/>The unit of <i>ntn-UISyncValidityDuration</i> is second. Value <i>s5</i> corresponds to 5 s, value <i>s10</i> indicate 10 s and so on. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> or <i>SatSwitchWithReSync</i> in an NTN cell, the UE uses validity duration from the serving cell assistance information. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> in a TN cell, how the UE sets the validity duration is left to UE implementation. This field is excluded when determining changes in system information, i.e. changes of <i>ntn-UISyncValidityDuration</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>. <i>ntn-UISyncValidityDuration</i> is only updated when at least one of <i>epochTime</i>, <i>ta-Info</i>, <i>ephemerisInfo</i> is updated.</p> |
| <p><b><i>ta-Common</i></b><br/>Network-controlled common timing advance value and it may include any timing offset considered necessary by the network. <i>ta-Common</i> with value of 0 is supported. The granularity of <i>ta-Common</i> is <math>4.072 \times 10^{-3}</math> <math>\mu</math>s. Values are given in unit of corresponding granularity. This field is excluded when determining changes in system information, i.e. changes of <i>ta-Common</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## – *NZP-CSI-RS-ResourceSet*

The IE *NZP-CSI-RS-ResourceSet* is a set of Non-Zero-Power (NZP) CSI-RS resources (their IDs) and set-specific parameters.

### *NZP-CSI-RS-ResourceSet* information element

```

| <b>NZP-CSI-RS-ResourceSet field descriptions</b>                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>aperiodicTriggeringOffset</i>, <i>aperiodicTriggeringOffset-r16</i>, <i>aperiodicTriggeringOffset-r17</i></b> | Offset X between the slot containing the DCI that triggers a set of aperiodic NZP CSI-RS resources and the slot in which the CSI-RS resource set is transmitted. For <i>aperiodicTriggeringOffset</i> , the value 0 corresponds to 0 slots, value 1 corresponds to 1 slot, value 2 corresponds to 2 slots, value 3 corresponds to 3 slots, value 4 corresponds to 4 slots, value 5 corresponds to 16 slots, value 6 corresponds to 24 slots. For <i>aperiodicTriggeringOffset-r16</i> and <i>aperiodicTriggeringOffset-r17</i> , the value indicates the number of slots. <i>aperiodicTriggeringOffset-r17</i> is applicable to SCS 480 kHz and 960 kHz, and only the values of integer multiples of 4 are valid, i.e. 0, 4, 8, and so on. The network configures only one of the fields. When neither field is included, the UE applies the value 0. This field is not present in case <i>NZP-CSI-RS-ResourceSet</i> is received as part of an <i>LTM-Candidate</i> IE. |
| <b><i>aperiodicTriggeringOffsetL2</i></b>                                                                           | Indicates triggering offset of aperiodic NZP CSI-RS resources used for fast activation of the SCell (see clause 5.2.1.5.3 of TS 38.214 [19]), when the NZP CSI-RS resources are activated by the MAC CE (see clause 5.9 of TS 38.321 [3]). The value indicates the number of slots. This field is not present in case <i>NZP-CSI-RS-ResourceSet</i> is received as part of an <i>LTM-Candidate</i> IE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>cmrGroupingAndPairing</i></b>                                                                                 | Configures CMR groups and pairs. The first <i>nrofResourcesGroup1</i> resources in the NZP-CSI-RS resource set belong to Group 1 and the remaining resources in the NZP-CSI-RS resource set belong to Group 2. <i>nrofResourcesGroup1</i> is $K_1$ and the number of remaining resources in the NZP-CSI-RS resource set belonging to Group 2 is $K_2$ as specified in TS 38.214 clause 5.2.1.4.1. Maximum total number in Group 1 and Group 2 is 8 (see TS 38.214 [19], clauses 5.2.1.4.1 and 5.2.1.4.2). This field is not present in case <i>NZP-CSI-RS-ResourceSet</i> is received as part of an <i>LTM-Candidate</i> IE.                                                                                                                                                                                                                                                                                                                                             |
| <b><i>pair1OfNZP-CSI-RS</i>, <i>pair2OfNZP-CSI-RS</i></b>                                                           | A pair of NZP CSI-RS resources. In one pair, one resource shall belong to group 1 and the other resource shall belong to group 2 (see TS 38.214 [19], clause 5.2.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>nzp-CSI-RS-Resources</i></b>                                                                                  | NZP-CSI-RS-Resources associated with this NZP-CSI-RS resource set (see TS 38.214 [19], clause 5.2). If the <i>NZP-CSI-RS-ResourceSet</i> is indicated in a <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> in a <i>CSI-ReportConfig</i> , if the <i>codebookType</i> in the <i>codebookConfig</i> in the <i>CSI-ReportConfig</i> is <i>typeII-Doppler-r18</i> or <i>typeII-DopplerPortSelection-r18</i> , there are at most 1 periodic or semi-persistent NZP CSI-RS resource and 4, 8 or 12 aperiodic NZP CSI-RS resources and if the <i>codebookType</i> is <i>typeII-CJT-r18</i> or <i>typeII-CJT-PortSelection-r18</i> , there are 1, 2, 3, or 4 aperiodic, periodic or semi-persistent NZP-CSI-RS resources, see TS 38.214 [19], clause 5.2.1.4.                                                                                                                                                                                       |
| <b><i>nzp-CSI-RS-ResourceId1</i>, <i>nzp-CSI-RS-ResourceId2</i></b>                                                 | The <i>nzp-CSI-RS-ResourceId1-r17</i> represents the index of the NZP CSI-RS resource in Resource Group 1, and <i>nzp-CSI-RS-ResourceId2-r17</i> represents the index of the NZP CSI-RS resource in Resource Group 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>pdcc-Info</i></b>                                                                                             | Indicates that this NZP-CSI-RS-ResourceSet, if configured also with <i>trs-Info</i> , is used for propagation delay compensation. The field can be present only if <i>trs-info</i> is present. The field can be present in only one <i>NZP-CSI-RS-ResourceSet</i> . If network configures this field for an <i>NZP-CSI-RS-ResourceSet</i> , the UE measures the UE Rx-Tx time difference based on resources configured in this resource set. This field is not present in case <i>NZP-CSI-RS-ResourceSet</i> is received as part of an <i>LTM-Candidate</i> IE.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>repetition</i></b>                                                                                            | Indicates whether repetition is on/off. If the field is set to <i>off</i> or if the field is absent, the UE may not assume that the NZP-CSI-RS resources within the resource set are transmitted with the same downlink spatial domain transmission filter (see TS 38.214 [19], clauses 5.2.2.3.1 and 5.1.6.1.2). It can only be configured for CSI-RS resource sets which are associated with <i>CSI-ReportConfig</i> with report of L1 RSRP, L1 SINR or "no report". This field is not present in case <i>NZP-CSI-RS-ResourceSet</i> is received as part of an <i>LTM-Candidate</i> IE.                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>resourceType</i></b>                                                                                          | Time domain behavior of resource configuration (see TS 38.214 [19], clause 5.2.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>trs-Info</i></b>                                                                                              | Indicates that the antenna port for all NZP-CSI-RS resources in the CSI-RS resource set is same. If the field is absent or released the UE applies the value <i>false</i> (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Conditional Presence | Explanation                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| <i>LTM</i>           | The field is optionally present, Need R, in an <i>LTM-Candidate</i> IE. Otherwise, the field is absent. |

## — *NZP-CSI-RS-ResourceSetId*

The IE *NZP-CSI-RS-ResourceSetId* is used to identify one *NZP-CSI-RS-ResourceSet*.

### *NZP-CSI-RS-ResourceSetId* information element

```
-- ASN1START
-- TAG-NZP-CSI-RS-RESOURCESETID-START

NZP-CSI-RS-ResourceSetId ::= INTEGER (0..maxNrofNZP-CSI-RS-ResourceSets-1)

-- TAG-NZP-CSI-RS-RESOURCESETID-STOP
-- ASN1STOP
```

## — *P-Max*

The IE *P-Max* is used to limit the UE's uplink transmission power on a carrier frequency, in TS 38.101-1 [15] and in TS 38.101-5 [75], and is used to calculate the parameter *Pcompensation* defined in TS 38.304 [20]. In ATG cell, actual value of P-Max = 9 + field value [dBm].

### *P-Max* information element

```
-- ASN1START
-- TAG-P-MAX-START

P-Max ::= INTEGER (-30..33)

-- TAG-P-MAX-STOP
-- ASN1STOP
```

## — *PathlossReferenceRS*

The IE *PathlossReferenceRS* is used to configure a Reference Signal (e.g. a CSI-RS config or a SS block) to be used for path loss estimation for PUSCH, PUCCH and SRS for unified TCI state operation.

### *PathlossReferenceRS* information element

```
-- ASN1START
-- TAG-PATHLOSSREFERENCERS-START

PathlossReferenceRS-r17 ::= SEQUENCE {
    pathlossReferenceRS-Id-r17 PathlossReferenceRS-Id-r17,
    referenceSignal-r17 CHOICE {
        ssb-Index SSB-Index,
        csi-RS-Index NZP-CSI-RS-ResourceId
    },
    additionalPCI-r17 AdditionalPCIIndex-r17 OPTIONAL -- Cond RS-SSB
```

}

-- TAG-PATHLOSSREFERENCERS-STOP  
-- ASN1STOP

| <i>PathlossReferenceRS</i> field descriptions                                                           |
|---------------------------------------------------------------------------------------------------------|
| <b><i>additionalPCI</i></b><br>Indicates the physical cell ID (PCI) of the SSB for the referenceSignal. |

| Conditional Presence | Explanation                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>RS-SSB</i>        | The field is optionally present, Need R, if <i>ssb-Index</i> is configured for <i>referenceSignal</i> . Otherwise it is absent, Need R. |

— *PathlossReferenceRS-Id*

The IE *PathlossReferenceRS-Id* is an ID for a reference signal (RS) configured as PUSCH, PUCCH and SRS pathloss reference RS for unified TCI state operation.

*PathlossReferenceRS-Id* information element

-- ASN1START  
-- TAG-PATHLOSSREFERENCERS-ID-START

PathlossReferenceRS-Id-r17 ::= INTEGER (0..maxNrofPathlossReferenceRSs-1-r17)

-- TAG-PATHLOSSREFERENCERS-ID-STOP  
-- ASN1STOP

— *PCI-ARFCN-EUTRA*

The IE *PCI-ARFCN-EUTRA* is used to encode EUTRA PCI and ARFCN.

*PCI-ARFCN-EUTRA* information element

-- ASN1START  
-- TAG-PCIARFCNEUTRA-START

PCI-ARFCN-EUTRA-r16 ::= SEQUENCE {  
    physCellId-r16 EUTRA-PhysCellId,  
    carrierFreq-r16 ARFCN-ValueEUTRA  
}

-- TAG-PCIARFCNEUTRA-STOP  
-- ASN1STOP

## — *PCI-ARFCN-NR*

The IE *PCI-ARFCN-NR* is used to encode NR PCI and ARFCN.

### *PCI-ARFCN-NR* information element

```
-- ASN1START
-- TAG-PCIARFCNNR-START

PCI-ARFCN-NR-r16 ::=
    physCellId-r16
    carrierFreq-r16
}

SEQUENCE {
    PhysCellId,
    ARFCN-ValueNR
}

-- TAG-PCIARFCNNR-STOP
-- ASN1STOP
```

## — *PCI-List*

The IE *PCI-List* concerns a list of physical cell identities, which may be used for different purposes.

### *PCI-List* information element

```
-- ASN1START
-- TAG-PCI-LIST-START

PCI-List ::=
    SEQUENCE (SIZE (1..maxNrofCellMeas)) OF PhysCellId

-- TAG-PCI-LIST-STOP
-- ASN1STOP
```

## — *PCI-Range*

The IE *PCI-Range* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range. For fields comprising multiple occurrences of *PCI-Range*, the Network may configure overlapping ranges of physical cell identities.

### *PCI-Range* information element

```
-- ASN1START
-- TAG-PCI-RANGE-START

PCI-Range ::=
    start
    range

SEQUENCE {
    PhysCellId,
    ENUMERATED {n4, n8, n12, n16, n24, n32, n48, n64, n84,
                n96, n128, n168, n252, n504, n1008, spare1}
}

OPTIONAL -- Need S
```

```
}
-- TAG-PCI-RANGE-STOP
-- ASN1STOP
```

| PCI-Range field descriptions                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>range</b><br>Indicates the number of physical cell identities in the range (including <i>start</i> ). Value <i>n4</i> corresponds with 4, value <i>n8</i> corresponds with 8 and so on. The UE shall apply value 1 in case the field is absent, in which case only the physical cell identity value indicated by <i>start</i> applies. |
| <b>start</b><br>Indicates the lowest physical cell identity in the range.                                                                                                                                                                                                                                                                 |

— PCI-RangeElement

The IE *PCI-RangeElement* is used to define a PCI-Range as part of a list (e.g. AddMod list).

PCI-RangeElement information element

```
-- ASN1START
-- TAG-PCI-RANGEELEMENT-START

PCI-RangeElement ::=
    pci-RangeIndex
    pci-Range
}
SEQUENCE {
    PCI-RangeIndex,
    PCI-Range
}

-- TAG-PCI-RANGEELEMENT-STOP
-- ASN1STOP
```

| PCI-RangeElement field descriptions                                                |
|------------------------------------------------------------------------------------|
| <b>pci-Range</b><br>Physical cell identity or a range of physical cell identities. |

— PCI-RangeIndex

The IE *PCI-RangeIndex* identifies a physical cell id range, which may be used for different purposes.

PCI-RangeIndex information element

```
-- ASN1START
-- TAG-PCI-RANGEINDEX-START

PCI-RangeIndex ::=
    INTEGER (1..maxNrofPCI-Ranges)
```

```
-- TAG-PCI-RANGEINDEX-STOP
-- ASN1STOP
```

## – *PCI-RangeIndexList*

The IE *PCI-RangeIndexList* concerns a list of indexes of physical cell id ranges, which may be used for different purposes.

### *PCI-RangeIndexList* information element

```
-- ASN1START
-- TAG-PCI-RANGEINDEXLIST-START

PCI-RangeIndexList ::=
    SEQUENCE (SIZE (1..maxNrofPCI-Ranges)) OF PCI-RangeIndex

-- TAG-PCI-RANGEINDEXLIST-STOP
-- ASN1STOP
```

## – *PDCCH-Config*

The IE *PDCCH-Config* is used to configure UE specific PDCCH parameters or MBS multicast PDCCH parameters such as control resource sets (CORESET), search spaces and additional parameters for acquiring the PDCCH. If this IE is used for the scheduled SCell in case of cross carrier scheduling, the fields other than *searchSpacesToAddModList* and *searchSpacesToReleaseList* are absent. If the IE is used for a dormant BWP, the fields other than *controlResourceSetToAddModList* and *controlResourceSetToReleaseList* are absent. If this IE is used for MBS CFR, the field *downlinkPreemption*, *tpc-PUSCH*, *tpc-SRS*, *uplinkCancellation*, *monitoringCapabilityConfig*, and *searchSpaceSwitchConfig* are absent.

### *PDCCH-Config* information element

```
-- ASN1START
-- TAG-PDCCH-CONFIG-START

PDCCH-Config ::=
    SEQUENCE {

| <b>PDCCH-Config field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>controlResourceSetToAddModList, controlResourceSetToAddModListSizeExt</i></b><br/> List of UE specifically configured Control Resource Sets (CORESETs) to be used by the UE. The network restrictions on configuration of CORESETs per DL BWP are specified in TS 38.213 [13], clause 10.1 and TS 38.306 [26]. The UE shall consider entries in <i>controlResourceSetToAddModList</i> and in <i>controlResourceSetToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>controlResourceSetToAddModList</i> can be modified using <i>controlResourceSetToAddModListSizeExt</i> (or deleted using <i>controlResourceSetToReleaseListSizeExt</i>) and vice-versa. In case network reconfigures control resource set with the same <i>ControlResourceSetId</i> as used for <i>commonControlResourceSet</i> or <i>commonControlResourceSetExt</i> configured via <i>PDCCH-ConfigCommon</i> or via <i>SIB20</i>, the configuration from <i>PDCCH-Config</i> always takes precedence and should not be updated by the UE based on <i>servingCellConfigCommon</i> or based on <i>SIB20</i>.</p> |
| <p><b><i>controlResourceSetToReleaseList, controlResourceSetToReleaseListSizeExt</i></b><br/> List of UE specifically configured Control Resource Sets (CORESETs) to be released by the UE. This field only applies to CORESETs configured by <i>controlResourceSetToAddModList</i> or <i>controlResourceSetToAddModListSizeExt</i> and does not release the field <i>commonControlResourceSet</i> configured by <i>PDCCH-ConfigCommon</i> and <i>commonControlResourceSetExt</i> configured by <i>SIB20</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>downlinkPreemption</i></b><br/> Configuration of downlink preemption indications to be monitored in this cell (see TS 38.213 [13], clause 11.2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>monitoringCapabilityConfig</i></b><br/> Configures either Rel-15 PDCCH monitoring capability, Rel-16 PDCCH monitoring capability or Rel-17 PDCCH monitoring capability for PDCCH monitoring on a serving cell (see TS 38.213 [13], clause 10.1). Value <i>r15monitoringcapability</i> enables the Rel-15 monitoring capability, and value <i>r16monitoringcapability</i> enables the Rel-16 PDCCH monitoring capability. <i>r17monitoringcapability</i> enables the Rel-17 PDCCH multi-slot monitoring capability. For 480 and 960 kHz SCS, only value <i>r17monitoringcapability</i> is applicable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>pdccch-MonitoringResumptionAfterNack</i></b><br/> This field is used to enable UE PDCCH monitoring resumption after PDCCH skipping has started, if the UE transmits a NACK due to incorrectly decoding a PDSCH scheduled by a DCI format received from the serving cell (see TS 38.213 [13], clause 10.4).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b><i>pdccch-SkippingDurationList</i></b><br/> Provides one or more values to derive the skipping duration in unit of slots, as specified in TS 38.213 [13], clause 10.4. The DCI which schedules data indicates which of the values is to be applied (see TS 38.213 [13], clause 10.4). For the 15kHz SCS, for each entry, only the first 26 values are valid and correspond to {1, 2, 3, ..., 20, 30, 40, 50, 60, 80, 100}. For the 30kHz SCS, for each entry, only the first 46 values are valid and correspond to {1, 2, 3, ..., 40, 60, 80, 100, 120, 160, 200}. For the 60kHz SCS, for each entry, only the first 86 values are valid and correspond to {1, 2, 3, ..., 80, 120, 160, 200, 240, 320, 400}. For the 120kHz SCS, for each entry, the 166 values correspond to {1, 2, 3, ..., 160, 240, 320, 400, 480, 640, 800}. For the 480kHz SCS, for each entry, the 166 values correspond to {4, 8, 12, ..., 640, 960, 1280, 1600, 1920, 2560, 3200}. For the 960kHz SCS, for each entry, the 166 values correspond to {8, 16, 24, ..., 1280, 1920, 2560, 3200, 3840, 5120, 6400}.</p>                   |
| <p><b><i>searchSpacesToAddModList, searchSpacesToAddModListExt</i></b><br/> List of UE specifically configured Search Spaces or MBS multicast Search Spaces. The network configures at most 10 Search Spaces per BWP per cell (including UE-specific and common Search Spaces). If the network includes <i>searchSpacesToAddModListExt</i>, it includes the same number of entries, and listed in the same order, as in <i>searchSpacesToAddModList</i> in each of them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>searchSpaceSwitchConfig</i></b><br/> Configuration to control the UE behavior to switch from search space group X back to search space group 0, as specified in clause 10 of TS 38.213 [13]. The network only configures either <i>searchSpaceSwitchConfig-r16</i> or <i>searchSpaceSwitchConfig-r17</i> for a UE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>tpc-PUCCH</i></b><br/> Enable and configure reception of group TPC commands for PUCCH.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b><i>tpc-PUSCH</i></b><br/> Enable and configure reception of group TPC commands for PUSCH.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b><i>cellGroupsForSwitchList</i></b><br>The list of serving cells which are bundled for the search space group switching purpose (see TS 38.213 [13], clause 10.4). A serving cell can belong to only one <i>CellGroupForSwitch</i> . The network configures the same list for all BWPs of serving cells in the same <i>CellGroupForSwitch</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>searchSpaceSwitchDelay</i></b><br>Indicates the value to be applied by a UE for Search Space Set Group switching; corresponds to the P value in TS 38.213 [13], clause 10.4. The network configures the same value for all BWPs of serving cells in the same <i>CellGroupForSwitch</i> . For 120/480/960 kHz SCS, only values 40,41, ... 52 are valid and the actual value = field value * SCS/120 kHz i.e. field value 40 corresponds to 40 with 120 kHz SCS, 160 with 480 kHz SCS and 320 with 960 kHz SCS, and so on.                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>searchSpaceSwitchTimer</i></b><br>Timer (in unit of slots) to control the UE behavior to switch from search space group X back to search space group 0, as specified in clause 10 of TS 38.213 [13]. For the 15kHz SCS, only the first 26 values are valid and correspond to {1, 2, 3, ..., 20, 30, 40, 50, 60, 80, 100}. For the 30kHz SCS, only the first 46 values are valid and correspond to {1, 2, 3, ..., 40, 60, 80, 100, 120, 160, 200}. For the 60kHz SCS, only the first 86 values are valid and correspond to {1, 2, 3, ..., 80, 120, 160, 200, 240, 320, 400}. For the 120kHz SCS, the 166 values correspond to {1, 2, 3, ..., 160, 240, 320, 400, 480, 640, 800}. For the 480kHz SCS, the 166 values correspond to {4, 8, 12, ..., 640, 960, 1280, 1600, 1920, 2560, 3200}. For the 960kHz SCS, the 166 values correspond to {8, 16, 24, ..., 1280, 1920, 2560, 3200, 3840, 5120, 6400}. |

## – *PDCCH-ConfigCommon*

The IE *PDCCH-ConfigCommon* is used to configure cell specific PDCCH parameters provided in SIB as well as in dedicated signalling.

| <i>PDCCH-ConfigCommon</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>applyIndicatedTCI-State</i></b><br/>This field indicates, for PDCCH reception in CORESET #0, if UE applies the first, the second, both or none of the "indicated" DL only TCI or joint TCI as specified in TS 38.213 [13], clause 10.1. Value <i>both</i> is not configured if the CORESET is associated with <i>searchSpaceZero</i> for Type 0/0A/2 common search space and can be configured only if <i>sfnSchemePDCCH</i> is configured in the serving cell.</p>                                                                                                                                                                                                                                                            |
| <p><b><i>commonControlResourceSet</i></b><br/>An additional common control resource set which may be configured and used for any common or UE-specific search space. If the network configures this field, it uses a <i>ControlResourceSetId</i> other than 0 for this <i>ControlResourceSet</i>. The network configures the <i>commonControlResourceSet</i> in <i>SIB1</i> so that it is contained in the bandwidth of CORESET#0. If the RedCap-specific initial downlink BWP does not contain the entire CORESET#0, the network configures the <i>commonControlResourceSet</i> in the RedCap-specific initial downlink BWP in <i>SIB1</i> for (e)RedCap such that it does not have to be contained in the bandwidth of CORESET#0.</p> |
| <p><b><i>commonSearchSpaceList</i>, <i>commonSearchSpaceListExt</i>, <i>commonSearchSpaceListExt2</i></b><br/>A list of additional common search spaces. If the network configures this field, it uses the <i>SearchSpaceIds</i> other than 0. If the field is included, it replaces any previous list, i.e. all the entries of the list are replaced and each of the <i>SearchSpace</i> entries is considered to be newly created and the conditions and Need codes for setup of the entry apply. If the network includes <i>commonSearchSpaceListExt</i>/<i>commonSearchSpaceListExt2</i>, it includes the same number of entries, and listed in the same order, as in <i>commonSearchSpaceList</i>.</p>                              |
| <p><b><i>controlResourceSetZero</i></b><br/>Parameters of the common CORESET#0 which can be used in any common or UE-specific search spaces. The values are interpreted like the corresponding bits in <i>MIB pdccch-ConfigSIB1</i>. Even though this field is only configured in the initial BWP (BWP#0) <i>controlResourceSetZero</i> can be used in search spaces configured in other DL BWP(s) than the initial DL BWP if the conditions defined in TS 38.213 [13], clause 10 are satisfied.</p>                                                                                                                                                                                                                                    |
| <p><b><i>firstPDCCH-MonitoringOccasionOfPEI-O</i></b><br/>Offset, in number of symbols, from the start of the reference frame for PEI-O to the start of the first PDCCH monitoring occasion of PEI-O on this BWP, see TS 38.213 [13], clause 10.4A. For the case <i>po-NumPerPEI</i> is smaller than <i>Ns</i>, UE applies the (floor(<math>\frac{N_s}{po-NumPerPEI}</math>)+1)-th value out of (<math>\frac{N_s}{po-NumPerPEI}</math>) configured values in <i>firstPDCCH-MonitoringOccasionOfPEI-O</i> for the symbol-level offset. When <i>po-NumPerPEI</i> is one or multiple of <i>Ns</i>, UE applies the first configured value in <i>firstPDCCH-MonitoringOccasionOfPEI-O</i> for the symbol-level offset.</p>                   |
| <p><b><i>firstPDCCH-MonitoringOccasionOfPO</i></b><br/>Indicates the first PDCCH monitoring occasion of each PO of the PF on this BWP, see TS 38.304 [20]. The field <i>sCS120KHZquarterT-SCS60KHZZoneEighthT-SCS30KHZZoneSixteenthT</i>, <i>sCS120KHZZoneEighthT-SCS60KHZZoneSixteenthT</i> and <i>sCS120KHZZoneSixteenthT</i> can be applied for SCS 480kHz, corresponding to <i>sCS480KHZZoneT-SCS120KHZquarterT-SCS60KHZZoneEighthT-SCS30KHZZoneSixteenthT</i>, <i>sCS480KHZhalfT-SCS120KHZZoneEighthT-SCS60KHZZoneSixteenthT</i> and <i>sCS480KHZquarterT-SCS120KHZZoneSixteenthT</i> in IE <i>DownlinkConfigCommonSIB</i> respectively.</p>                                                                                       |
| <p><b><i>followUnifiedTCI-State</i></b><br/>When set to enabled, for PDCCH reception in CORESET #0, the UE applies the "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b><i>pagingSearchSpace</i></b><br/>ID of the search space for paging (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive paging in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, an (e)RedCap UE in RRC_INACTIVE while SDT procedure is ongoing and T319a is not running, if CG-SDT is selected and if extended CG-SDT periodicity is configured (i.e. <i>cg-SDT-PeriodicityExt</i> is configured), or an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE while SDT procedure is not ongoing, shall monitor paging in the initial DL BWP that includes CORESET#0.</p>  |
| <p><b><i>pei-ConfigBWP</i></b><br/>Provides the configuration for PEI reception in this BWP. If the field is absent, the UE does not receive PEI in this BWP. For the <i>initialDownlinkBWP-RedCap</i> not including CD-SSB and the entire CORESET#0, an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE while SDT procedure is not ongoing monitors PEI in the <i>initialDownlinkBWP</i> that includes CORESET#0, if the <i>initialDownlinkBWP</i> is configured with <i>pei-ConfigBWP</i>.</p>                                                                                                                                                                                                                                               |
| <p><b><i>pei-SearchSpace</i></b><br/>ID of dedicated search space for PEI. It can be configured to one of up to 4 common SS sets configured by <i>commonSearchSpaceList</i> with <i>SearchSpaceId</i> &gt; 0. The CCE aggregation levels and maximum number of PDCCH candidates per CCE aggregation level follows Table 10.1-1 of TS38.213 [13]. <i>SearchSpaceId</i> = 0 can be configured for the case of SS/PBCH block and CORESET multiplexing pattern 2 or 3.</p>                                                                                                                                                                                                                                                                  |
| <p><b><i>ra-SearchSpace</i></b><br/>ID of the Search space for random access procedure (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive RAR in this BWP. This field is mandatory present in the DL BWP(s) if the conditions described in TS 38.321 [3], clause 5.15 are met.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sdt-SearchSpace</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Common search space for CG-SDT and RA-SDT (see TS 38.213 [13]). If an <i>existingSearchSpace</i> is used, the network only signals the search space ID of the <i>ra-SearchSpace</i> .                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>searchSpaceMCCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ID of the search space for MCCH. If the field is absent, the UE does not receive MCCH in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, the (e)RedCap UE in RRC_IDLE or RRC_INACTIVE may receive MCCH using <i>searchSpaceMCCH</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.                                                                                                                           |
| <b><i>searchSpaceMTCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ID of the search space for MTCH of MBS broadcast. If the field is absent, the UE applies <i>searchSpaceMCCH</i> also for MTCH, (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, the (e)RedCap UE in RRC_IDLE or RRC_INACTIVE may receive MTCH using <i>searchSpaceMTCH</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.                                                                                              |

| ID of the search space for multicast MCCH. If the field is absent, the UE does not receive multicast MCCH in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0.                                                                                                                                                                                                                                                                                     |
| <b><i>searchSpaceMulticastMTCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ID of the search space for multicast MTCH. If the field is absent, the UE applies <i>searchSpaceMulticastMCCH</i> also for multicast MTCH, (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0.                                                                                                                                                                                                                                                                |
| <b><i>searchSpaceOtherSystemInformation</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ID of the Search space for other system information, i.e., <i>SIB2</i> and beyond (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive other system information in this BWP. This field is absent for the RedCap-specific initial DL BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE shall monitor PDCCH to receive other system information using <i>searchSpaceOtherSystemInformation</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0. |
| <b><i>searchSpaceSIB1</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ID of the search space for <i>SIB1</i> message. In the initial DL BWP of the UE's PCell, the network sets this field to 0. If the field is absent, the UE does not receive <i>SIB1</i> in this BWP. (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial DL BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE shall monitor PDCCH to receive <i>SIB1</i> using <i>searchSpaceSIB1</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.      |
| <b><i>searchSpaceZero</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Parameters of the common SearchSpace#0. The values are interpreted like the corresponding bits in <i>MIB pdccch-ConfigSIB1</i> . Even though this field is only configured in the initial BWP (BWP#0), <i>searchSpaceZero</i> can be used in search spaces configured in other DL BWP(s) than the initial DL BWP if the conditions described in TS 38.213 [13], clause 10, are satisfied.                                                                                                                                                                             |

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FollowUTC1</i>        | The field is absent if the field <i>followUnifiedTCI-State</i> is present or if more than one value for the field <i>coresetPoolIndex</i> is configured in <i>controlResourceSet</i> for the same bandwidthpart. Otherwise, it is optionally present, Need R.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>InitialBWP-Only</i>   | If <i>SIB1</i> is broadcast the field is mandatory present in the <i>PDCCH-ConfigCommon</i> of the initial BWP (BWP#0) in <i>ServingCellConfigCommon</i> except it is the RedCap-specific initial BWP not including CD-SSB and the entire CORESET#0 in which case the field is absent, Need R; it is absent in other BWPs and when sent in system information. If <i>SIB1</i> is not broadcast and there is an SSB associated to the cell, the field is optionally present, Need M, in the <i>PDCCH-ConfigCommon</i> of the initial BWP (BWP#0) in <i>ServingCellConfigCommon</i> (still with the same setting for all UEs). In other cases, the field is absent. |
| <i>InitialBWP-Paging</i> | This field is optionally present, Need R, if this BWP is the <i>initialDownlinkBWP</i> or <i>initialDownlinkBWP-RedCap</i> including CD-SSB and the entire CORESET#0, and <i>pei-Config</i> is configured in <i>DownlinkConfigCommonSIB</i> . Otherwise, this field is absent.                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>OtherBWP</i>          | This field is optionally present, Need R, if this BWP is not the <i>initialDownlinkBWP</i> and <i>pagingSearchSpace</i> is configured in this BWP. Otherwise this field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b><i>cipheringDisabled</i></b><br>If included, ciphering is disabled for this DRB regardless of which ciphering algorithm is configured for the SRB/DRBs. The field may only be included if the UE is connected to 5GC. Otherwise the field is absent. The network configures all DRBs with the same PDU-session ID with same value for this field. The value for this field cannot be changed after the DRB is set up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>discardTimer</i></b><br>Value in ms of <i>discardTimer</i> specified in TS 38.323 [5]. Value <i>ms10</i> corresponds to 10 ms, value <i>ms20</i> corresponds to 20 ms and so on. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>discardTimerExt</i></b><br>Value in ms of <i>discardTimer</i> specified in TS 38.323 [5]. Value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms1</i> corresponds to 1ms and so on. If this field is present, the field <i>discardTimer</i> is ignored and <i>discardTimerExt</i> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>discardTimerExt2</i></b><br>Value in ms of <i>discardTimerExt</i> specified in TS 38.323 [5]. Value <i>ms2000</i> corresponds to 2000 ms. If this field is present, the field <i>discardTimer</i> and <i>discardTimerExt</i> are ignored and <i>discardTimerExt2</i> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>discardTimerForLowImportance</i></b><br>Value in ms of <i>discardTimerForLowImportance</i> specified in TS 38.323 [5]. Value <i>ms0</i> corresponds to 0 ms, value <i>ms2</i> corresponds to 2 ms and so on. The value of this timer for a PDCP entity is always configured shorter than <i>discardTimer</i> , <i>discardTimerExt</i> or <i>discardTimerExt2</i> , whichever is used for the PDCP entity. The presence of this field indicates that PSI-based SDU discard is configured for a DRB. The network configures at most 8 DRBs with <i>discardTimerForLowImportance</i> .                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>drb-ContinueROHC</i></b><br>Indicates whether the PDCP entity continues or resets the ROHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. This field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated. The network does not include the field if the bearer is configured as DAPS bearer. This field can be configured for both DRB and multicast MRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>duplicationState</i></b><br>This field indicates the uplink PDCP duplication state for the associated RLC entities at the time of receiving this IE. If set to <i>true</i> , the PDCP duplication state is activated for the associated RLC entity. The index for the indication is determined by ascending order of logical channel ID of all RLC entities other than the primary RLC entity indicated by <i>primaryPath</i> in the order of MCG and SCG, as in clause 6.1.3.32 of TS 38.321 [3]. For MP, the index for the indication is determined by ascending order of direct path (where <i>i</i> is ascending order of logical channel ID of secondary RLC entities) and indirect path, as in clause 6.1.3.32 of TS 38.321 [3]. If the number of associated RLC entities other than the primary RLC entity is two, UE ignores the value in the largest index of this field. If the field is absent, the PDCP duplication states are deactivated for all associated RLC entities. |
| <b><i>ethernetHeaderCompression</i></b><br>This fields configures Ethernet Header Compression. This field can only be configured for a bi-directional DRB or a bi-directional multicast MRB. The network reconfigures <i>ethernetHeaderCompression</i> only upon reconfiguration involving PDCP re-establishment and with neither <i>drb-ContinueEHC-DL</i> nor <i>drb-ContinueEHC-UL</i> configured. Network only configures this field when <i>uplinkDataCompression</i> is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>headerCompression</i></b><br>If rohc is configured, the UE shall apply the configured ROHC profile(s) in both uplink and downlink. If <i>uplinkOnlyROHC</i> is configured, the UE shall apply the configured ROHC profile(s) in uplink (there is no header compression in downlink). ROHC can be configured for any bearer type. ROHC and EHC can be both configured simultaneously for a DRB or a multicast MRB. The network reconfigures <i>headerCompression</i> only upon reconfiguration involving PDCP re-establishment or involving PDCP entity reconfiguration to configure DAPS bearer(s), and without any <i>drb-ContinueROHC</i> . Network configures <i>headerCompression</i> to <i>notUsed</i> when <i>outOfOrderDelivery</i> is configured. Network only configures this field when <i>uplinkDataCompression</i> is not configured.                                                                                                                                       |
| <b><i>initialRX-DELIV</i></b><br>Indicates the initial value of RX_DELIV during PDCP window initialization for multicast MRB as specified in TS 38.323 [5]. The first/leftmost bit of the bit string contains the most significant bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>integrityProtection</i></b><br>Indicates whether or not integrity protection is configured for this radio bearer. The network configures all DRBs with the same PDU-session ID with same value for this field. The value for this field cannot be changed after the DRB is set up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b><i>moreThanTwoRLC-DRB</i></b><br>This field configures UL data transmission when more than two RLC entities are associated with the PDCP entity for DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>outOfOrderDelivery</i></b><br>Indicates whether or not <i>outOfOrderDelivery</i> specified in TS 38.323 [5] is configured. This field should be either always present or always absent, after the radio bearer is established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>pdcp-Duplication</i></b><br>Indicates whether or not uplink duplication status at the time of receiving this IE is configured and activated as specified in TS 38.323 [5]. The presence of this field indicates that duplication is configured. PDCP duplication is not configured for CA packet duplication of LTE RLC bearer. The value of this field, when the field is present, indicates the state of the duplication at the time of receiving this IE. If set to <i>true</i> , duplication is activated. The value of this field is always <i>true</i> , when configured for a SRB. For PDCP entity with more than two associated RLC entities for UL transmission, this field is always present. If the field <i>moreThanTwoRLC-DRB</i> is present, the value of this field is ignored and the state of the duplication is indicated by <i>duplicationState</i> . For PDCP entity with more than two associated RLC entities, only NR RLC bearer is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>pdcp-SN-SizeDL</i></b><br>PDCP sequence number size for downlink, 12 or 18 bits, as specified in TS 38.323 [5]. For SRBs only the value <i>len12bits</i> is applicable. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>pdu-SetDiscard</i></b><br>If set to true, the UE shall perform PDU Set based discarding for this PDCP entity, as specified in TS 38.323 [5]. This field is only configured for a DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>primaryPath</i></b><br>Indicates the cell group ID and LCID of the primary RLC entity as specified in TS 38.323 [5], clause 5.2.1 for UL data transmission when more than one RLC entity is associated with the PDCP entity. In this version of the specification, only cell group ID corresponding to MCG is supported for SRBs, except for the split SRB2 of the IAB-MT, and except when the UE is required to set the <i>primaryPath</i> to refer to the SCG or indirect path as specified in clause 5.7.3b.4. In this last case, if the network sends an <i>RRCReconfiguration</i> message (in NR-DC) or an EUTRA <i>RRCConnectionReconfiguration</i> message (in (NG)EN-DC) keeping SRB1 as split SRB, the network explicitly configures the <i>primaryPath</i> for the PDCP entity of SRB1 to refer to the MCG. In this version of the specification, only cell group ID corresponding to MCG is supported for DRBs when the SCG is deactivated. In MR-DC, the NW indicates <i>cellGroup</i> for split bearers using logical channels in different cell groups. The NW always indicates <i>logicalChannel</i> if CA based PDCP duplication is configured in the cell group indicated by <i>cellGroup</i> of this field. This field is also used for configuring Multi-path Primary Path defined in [5] for MP operation. In MP, when the primary path is indirect path, the field <i>cellGroup</i> and <i>logicalChannel</i> are absent, and the field <i>primaryPathOnIndirectPath</i> is set to true. |
| <b><i>primaryPathOnIndirectPath</i></b><br>Indicates that the primary path is SL indirect path, or primary path is associated with the N3C indirect path, for DRB when MP is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>sn-GapReport</i></b><br>Indicates whether the PDCP entity is configured to send a PDCP SN gap report in the uplink, as specified in TS 38.323 [5]. This field is only configured for DRBs. This field can be included only if <i>outOfOrderDelivery</i> is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>splitSecondaryPath</i></b><br>Indicates the LCID of the split secondary RLC entity as specified in TS 38.323 [5] for fallback to split bearer operation when UL data transmission with more than two RLC entities is associated with the PDCP entity. This RLC entity belongs to a cell group that is different from the cell group indicated by <i>cellGroup</i> in the field <i>primaryPath</i> . This RLC entity belongs to the cell group of the direct path if <i>primaryPathOnIndirectPath</i> is set to <i>true</i> in MP case.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b><i>PDCP-Config field descriptions</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>statusReportRequired</i></b><br>For AM DRBs, AM MRBs and DAPS UM DRBs, indicates whether the DRB or the multicast MRB is configured to send a PDCP status report in the uplink, as specified in TS 38.323 [5]. For DAPS AM DRBs, it also indicates whether the DRB is configured to send a second PDCP status report in the uplink, as specified in TS 38.323 [5].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>survivalTimeStateSupport</i></b><br>Indicates whether the DRB associated with this PDCP entity has survival time state support. If this field is configured to be true, all associated RLC entities are activated for PDCP duplication upon reception of a retransmission grant addressed to CS-RNTI, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>t-Reordering</i></b><br>Value in ms of t-Reordering specified in TS 38.323 [5]. Value <i>ms0</i> corresponds to 0 ms, value <i>ms20</i> corresponds to 20 ms, value <i>ms40</i> corresponds to 40 ms, and so on. When the field is absent the UE applies the value <i>infinity</i> . The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>ul-DataSplitThreshold</i></b><br>Parameter specified in TS 38.323 [5]. Value <i>b0</i> corresponds to 0 bytes, value <i>b100</i> corresponds to 100 bytes, value <i>b200</i> corresponds to 200 bytes, and so on. The network sets this field to <i>infinity</i> for UEs not supporting <i>splitDRB-withUL-Both-MCG-SCG</i> and when the SCG is deactivated or for multi-path U2N Remote UEs not supporting <i>splitDRB-WithUL-BothDirectIndirect</i> . If the field is absent when the split bearer is configured for the radio bearer first time, then the default value <i>infinity</i> is applied.                                                                                                                                                                                                                                                                                                               |
| <b><i>uplinkDataCompression</i></b><br>Indicates the UDC configuration that the UE shall apply. Network does not configure <i>uplinkDataCompression</i> for a DRB, if <i>headerCompression</i> or <i>ethernetHeaderCompression</i> is already configured or <i>outOfOrderDelivery</i> or DAPS is configured for the DRB. The maximum number of DRBs where <i>uplinkDataCompression</i> can be applied is two. The network reconfigures <i>uplinkDataCompression</i> only upon reconfiguration involving PDCP re-establishment. If the field is set to <i>drb-ContinueUDC</i> , the PDCP entity continues the uplink data compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is set to <i>drb-ContinueUDC</i> only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated. |
| <b><i>EthernetHeaderCompression field descriptions</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>drb-ContinueEHC-DL</i></b><br>Indicates whether the PDCP entity continues or resets the downlink EHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>drb-ContinueEHC-UL</i></b><br>Indicates whether the PDCP entity continues or resets the uplink EHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>ehc-CID-Length</i></b><br>Indicates the length of the CID field for EHC packet. The value <i>bits7</i> indicates the length is 7 bits, and the value <i>bits15</i> indicates the length is 15 bits. Once the field <i>ethernetHeaderCompression-r16</i> is configured for a DRB or a multicast MRB, the value of the field <i>ehc-CID-Length</i> for this DRB or multicast MRB is not reconfigured to a different value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>ehc-Common</i></b><br>Indicates the configurations that apply for both downlink and uplink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>ehc-Downlink</i></b><br>Indicates the configurations that apply for only downlink. If the field is configured, then Ethernet header compression is configured for downlink. Otherwise, it is not configured for downlink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
