Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 2: SS-SINR, SSB_RP, and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 3: SS-SINR and SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 5: As observed with 0 dBi gain antenna at the centre of the quiet zone.

Note 6: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

## 17.7.4.2 NR SA FR2-FR2 SS-SINR measurement accuracy for 2 Rx UE

Editor's Note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz

- UE PC3
- Normal conditions
- The test is incomplete for UE power classes other than PC3
- The test is incomplete for test frequencies > 40.8 GHz
- The test is incomplete for extreme conditions

#### 17.7.4.2.1 Test purpose

The purpose of this test is to verify that the inter-frequency SS-SINR measurement accuracy is within the specified limits for all bands.

#### 17.7.4.2.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards and supporting SS-SINR measurements.

#### 17.7.4.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.7.4.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.17.7.4.2.

# 18 E-UTRA - NR inter-RAT with E-UTRA serving cell for RedCap

## 18.1 RRC_IDLE state mobility for RedCap

### 18.1.1 Inter-RAT cell re-selection for RedCap

#### 18.1.1.0 Minimum conformance requirements

TBD

#### 18.1.1.1 E-UTRA - NR SA FR1 E-UTRA cell re-selection to higher priority NR target Cell for 2 Rx UE

Editor's Note: This test case is incomplete in following aspects:

- Message contents are missing.
- Test procedure is TBD
- Test applicability is missing
- Cell mapping is missing

##### 18.1.1.1.1 Test purpose

The purpose of this test is to verify the requirement for the E-UTRA - NR SA FR1 inter-RAT cell reselection for RedCap UEs. The requirements are specified in TS 38.133 [6] in clause TBD.

##### 18.1.1.1.2 Test applicability

This test applies to all types of NR RedCap UE release 17 and forward.

##### 18.1.1.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 18.1.1.0.x.

The normative reference for this requirement is TS 38.133 [6] clause A.18.1.1.1.

18.1.1.1.4 Test description

18.1.1.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 18.1.1.1.4.1-1.

**Table 18.1.1.1.4.1-1: Supported test configurations for E-UTRA - NR SA FR1 E-UTRA Cell re-selection to higher priority NR target Cell in FR1**

Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The cell reselection delay to a higher priority NR cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search} + T_{evaluate, NR} + T_{SI-NR,}$ and to a lower priority cell can be expressed as: $T_{evaluate, NR} + T_{SI-NR,}$

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

### 18.2.1.0 Minimum conformance requirements

Then minimum requirements given in clause 16.3.1.0.2 apply.

The normative reference for this requirement is TS 36.133 [23] clause 5.3.4B.

### 18.2.1.1 E-UTRA - NR SA FR1 handover for 2 Rx UE

#### 18.2.1.1.1 Test purpose

To verify the E-UTRAN to NR FR1 handover requirements for 2RX RedCap as specified in TS 36.133 [23] clause 5.3.4B.

#### 18.2.1.1.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx.

#### 18.2.1.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 18.2.1.0

The normative reference for this requirement is TS 38.133 [6] clause A.18.2.1.1.

## 18.2.2 RRC connection release with redirection for RedCap

### 18.2.2.0 Minimum conformance requirements

#### 18.2.2.0.1 Redirection from E-UTRA to FR1 RedCap UE

The RedCap UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR_RedCap}$.

The time delay ($T_{connection_release_redirect_NR_RedCap}$) is the time between the end of the last TTI containing the RRC command, "*RRCConnectionRelease*" (TS 36.331 [2]) on the E-UTRAN PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR_RedCap}$) shall be less than:

$$T_{connection_release_redirect_NR_RedCap} = T_{RRC_procedure_delay} + T_{identify\text{-}NR_Redcap} + T_{SI\text{-}NR_RedCap} + T_{RACH_RedCap}$$

The target NR cell shall be considered detectable for 1 Rx RedCap when for each relevant SSB:

- SSB_RP and SSB $\hat{E}s/Iot$ according to Annex B.2.X of TS 38.133 [6] for a corresponding NR Band.

The target NR cell shall be considered detectable for 2 Rx RedCap when for each relevant SSB:

- SSB_RP and SSB $\hat{E}s/Iot$ according to Annex B.2.X of TS 38.133 [6] for a corresponding NR Band.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCConnectionRelease*" as defined in clause 6.2.2 of TS 36.331 [2]. It shall be less than 110 ms.

$T_{identify-NR_RedCap}$: It is the time to identify the target NR cell and depends on the frequency range (FR) of the target NR cell. It is defined in Table 18.2.2.0-1 for 1 Rx RedCap for FR1 and in Table 18.2.2.0-2 for 2 Rx RedCap. $T_{identify-NR_RedCap} = T_{PSS/SSS-sync_RedCap} + T_{meas_RedCap}$, where $T_{PSS/SSS-sync_RedCap}$ is the cell search time and $T_{meas_RedCap}$ is the measurement time due to cell selection criteria evaluation. The RedCap UE operating in NR HD-FDD shall meet the requirements in this section provided that the SSB is available at the UE at least once every SMTC period during $T_{identify-NR_RedCap}$.

$T_{SI-NR_RedCap}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

$T_{RACH_RedCap}$: It is the delay caused due to the random access procedure when sending random access to the target NR cell. $T_{RACH_RedCap}$ can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [39]. The RedCap UE operating in NR HD-FDD mode shall perform the PRACH transmission on the PRACH resource of the target NR cell provided that the UE has received at least one SSB associated with the PRACH resource during the last [TBD] period in the target NR cell.

$T_{rs}$ is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise $T_{rs}$ is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this section is applied with $T_{rs}$ = 20 ms assuming the SSB transmission periodicity is not larger than 20 ms,
- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

**Table 18.2.2.0-1: Time to identify target NR cell for RRC connection release with redirection to NR for 1 Rx RedCap**

| Frequency range (FR) of target NR cell | $T_{identify-NR_RedCap}$ |
|---|---|
| FR1 | MAX (680 ms, 12 x Trs) |

**Table 18.2.2.0-2: Time to identify target NR cell for RRC connection release with redirection to NR for 2 Rx RedCap**

| Frequency range (FR) of target NR cell | $T_{identify-NR_RedCap}$ |
|---|---|
| FR1 | MAX (680 ms, 11 x Trs) |
| FR2 | MAX (880 ms, 88 x Trs) |

The normative reference for this requirement is TS 36.133 [23] clause 6.3.2.6.

## 18.2.2.1 E-UTRA - NR SA FR1 RRC connection release with redirection for 2 Rx UE

### 18.2.2.1.1 Test purpose

To verify RRC connection release with redirection from E-UTRA to NR requirements for 2Rx RedCap specified in TS 36.133 [23] clause 6.3.2.6.

### 18.2.2.1.2 Test applicability

This test applies to all types of NR RedCap UE with 2Rx from Release 17 onwards.

### 18.2.2.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 18.2.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clauses A.18.2.2.1.

18.2.2.1.4 Test description

18.2.2.1.4.2 Test procedure

The test consists of two successive time periods, with time duration of T1, and T2 respectively. The *RRCConnectionRelease* message shall be sent to the UE during period T1 and the start of T2 is the instant when the last

TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2.

1. Ensure the UE is in State 3A-RF according to TS 36.508 [25] clause 7.2A.3.
2. Set the parameters according to T1 in Table 18.2.2.1.5-1 for Cell 1 and Table 18.2.2.1.5-2 for Cell 2. T1 starts.
3. SS shall transmit an *RRCConnectionRelease* with *redirectedCarrierInfo* during period T1.
4. The SS shall start T2 timer when the last TTI containing the *RRCConnectionRelease* message is sent to UE.
5. When T2 starts, the SS shall switch the power setting from T1 to T2 as specified in Table 18.2.2.1.5-1 for Cell 1 and in Table 18.2.2.1.5-2 for Cell 2.
6. The UE shall transmit an *RRCSetupRequest* message.
7. If the UE transmits the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
8. After T2 expires, the UE shall be switched off. Then ensure the UE is in State 3A-RF according to TS 36.508 [25] clause 7.2A.3. Cell 1 is the active cell and Cell 2 shall be powered OFF.
9. The SS shall set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.
10. Repeat step 2-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

|---|---|

The UE shall start to transmit the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2.
The rate of correct RRC connection release redirection to NR observed during repeated tests shall be at least 90%.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_NR_RedCap} = T_{RRC_procedure_delay} + T_{identify\text{-}NR_Redcap} + T_{SI\text{-}NR_RedCap} + T_{RACH_RedCap}$$

where:

$T_{RRC_procedure_delay}$ = 110 ms and is specified in clause 12 in TS 38.331 [13].

$T_{identify\text{-}NR}$ = 680 ms in the test.

$T_{SI\text{-}NR_RedCap}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 38.331[13] for the target NR cell.

$T_{RACH_RedCap}$ = 170 ms in the test.

This gives a total of 2240 ms.

# 18.3 Measurement procedure for RedCap

## 18.3.1 E-UTRA - NR Measurements for RedCap

### 18.3.1.0 Minimum conformance requirements

#### 18.3.1.0.1 Minimum conformance requirements for E-UTRA - NR event-triggered measurement

The UE shall be able to identify new inter-RAT NR cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-RAT cells if carrier frequency information is provided by the PCell, even if no explicit neighbour list with physical layer cell identities is provided.

Requirements in this clause are applicable to both E-UTRA FDD and E-UTRA TDD serving cell.

When measurement gaps are scheduled, the RedCap UE shall be able to identify a new detectable cell within $T_{identify_irat_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise, UE shall be able to identify a new detectable inter-RAT cell within $T_{identify_irat_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-RAT SS block of an already detected cell within $T_{identify_irat_without_index_RedCap.}$

$$T_{identify_irat_without_index_RedCap} = (T_{PSS/SSS_sync_irat_RedCap} + T_{SSB_measurement_period_irat_RedCap}) \text{ ms}$$

$$T_{identify_irat_with_index_RedCap} = (T_{PSS/SSS_sync_irat_RedCap} + T_{SSB_measurement_period_irat_RedCap} + T_{SSB_time_index_irat_RedCap}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_irat_RedCap}$: it is the time period used in PSS/SSS detection given in Table 18.3.1.0.1-1 and Table 18.3.1.0.1-3 for 2 Rx RedCap, Table 18.3.1.0.1-2 for 1 Rx RedCap.

$T_{SSB_time_index_irat_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in Table 18.3.1.0.1-4 and Table 18.3.1.0.1-6 for 2 Rx RedCap, Table 18.3.1.0.1-5 for 1 Rx RedCap.

$T_{SSB_measurement_period_irat_RedCap}$: equal to a measurement period of SSB based measurement given in Table 18.3.1.0.1-7 and Table 18.3.1.0.1-9 for 2 Rx RedCap, Table 18.3.1.0.1-8 for 1 Rx RedCap.

$M_{pss/sss_sync_irat_RedCap}$: For a 2 Rx RedCap supporting FR2 power class 7, $M_{pss/sss_sync_irat_RedCap}$ = 40 samples.

$M_{SSB_index_irat_RedCap}$: For a 2 Rx RedCap supporting FR2 power class 7, $M_{SSB_index_irat_RedCap}$ = 40 samples.

$M_{meas_period_irat_RedCap}$: For a 2 Rx RedCap supporting FR2 power class 7, $M_{meas_period_irat}$ = 40 samples.

$N_{freq_RedCap}$ is defined in TS 38.133 [6] clause 8.1.2.1.1d.

In the requirements, an NR cell is considered detectable when:

- NR SS-RSRP related conditions in the accuracy requirements in Section 9.11.x are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 of TS 38.133 [50],
- NR SS-RSRQ related conditions in the accuracy requirements in Section 9.11.y are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 of TS 38.133 [50],
- NR SS-SINR related conditions in the accuracy requirements in Section 9.11.z are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 of TS 38.133 [50].

The RedCap UE operating in NR HD-FDD shall meet the current PSS/SSS detection requirements provided that at least 5 SMTC windows are available at the UE during the PSS/SSS detection time.

The RedCap UE operating in NR HD-FDD shall meet the current time index detection requirements provided that at least 3 SMTC windows are available at the UE during the time index detection time.

When measurement gaps are scheduled for NR measurements the UE physical layer shall be capable of reporting NR SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clause 9.11, with measurement period as shown in table 8.20.2.1-5 and 8.20.2.1-6 for 2Rx UE, table 8.20.2.1-5a for 1Rx UE:

| No DRX | $Max(400ms, M_{meas_period_irat_RedCap} \times Max(MGRP, SMTC\ period)) \times N_{freq_RedCap}$ |
| DRX cycle ≤ 320ms | $Max(400ms, (1.5 \times M_{meas_period_irat_RedCap}) \times Max(MGRP, SMTC\ period, DRX\ cycle)) \times N_{freq_RedCap}$ |
| DRX cycle > 320ms | $M_{meas_period_irat_RedCap} \times DRX\ cycle \times N_{freq_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in section 3.6.1 of TS 38.133 [50]. | |

The RedCap UE operating in NR HD-FDD shall meet the current measurement requirements provided that at least 5 SMTC windows are available at the UE during the measurement period.

Reported measurements in event triggered measurement reports shall meet the requirements in clause 9.

The UE shall not send any event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The measurement reporting delay is defined as the time between any event that will trigger a measurement report until the UE starts to transmit the measurement report over the Uu interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify_irat_without_index_RedCap}$ or $T_{identify_irat_with_index_RedCap}$ for the minimum requirements.

If an NR cell which has been detectable at least for the time period $T_{identify_irat_without_index_RedCap}$. or $T_{identify_irat_with_index_RedCap}$ defined in clause 8.20.2.1 for the minimum requirements and then triggers the measurement report as per TS 36.331 [2], the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_irat_RedCap}$ defined in clause 8.20.2.1 provided the timing to that cell has not changed more than ±3200 Tc while measurement gap has not been available and the L3 filter has not been used.

## 18.3.1.1 E-UTRA - NR SA FR1 event triggered reporting without SSB time index detection in non-DRX

### 18.3.1.1.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

### 18.3.1.1.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx.

### 18.3.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.1.

## 18.3.1.3 E-UTRA - NR SA FR1 event triggered reporting with SSB time index detection in non-DRX

### 18.3.1.3.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

#### 18.3.1.3.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx.

#### 18.3.1.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.3.

#### 18.3.1.3.4 Test description

Same as the test description given in clause 8.4.2.3.4.

## 18.3.1.5 E-UTRA - NR SA FR2 event triggered reporting without SSB time index detection in non-DRX

Editor's Notes: This test case is incomplete:

- E-UTRA – NR FR2 testability issue is not cleared.
- The TT analysis is complete for test frequencies f ≤ 40.8 GHz
- The TT analysis is complete for UE PC3
- This test case is incomplete for UE power classes other than PC3
- This test case is incomplete for Test frequencies f > 40.8 GHz

### 18.3.1.5.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

### 18.3.1.5.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx. Test 1 applies to UEs not supporting per-FR gap and test 2 applies only to UEs supporting per-FR gap.

### 18.3.1.5.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.5.

### 18.3.1.8 E-UTRA - NR SA FR2 event triggered reporting with SSB time index detection in DRX

Editor's Notes: This test case is incomplete:

- E-UTRA – NR FR2 testability issue is not cleared.
- The TT analysis is complete for test frequencies f ≤ 40.8 GHz
- The TT analysis is complete for UE PC3
- This test case is incomplete for UE power classes other than PC3
- This test case is incomplete for Test frequencies f > 40.8 GHz

#### 18.3.1.8.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

#### 18.3.1.8.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx. Test 1 and test 2 apply to UEs not supporting per-FR gap. Test 3 and test 4 apply only to UEs supporting per-FR gap.

#### 18.3.1.8.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.8.

# 19 NR standalone tests for ATG

## 19.2 RRC_CONNECTED state mobility

### 19.2.1 Handover for ATG

#### 19.2.1.0 Minimum conformance requirements

##### 19.2.1.0.1 Minimum conformance requirements for NR FR1 – NR FR1 handover

When the UE receives a RRC message implying handover to NR cell, the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command. $D_{handover}$ is defined as

$$D_{handover} = T_{RRC_procedure_delay} + T_{interruption}$$

Where:

$T_{RRC_procedure_delay}$: it is the RRC procedure delay, which is 10ms

$T_{interruption}$: it is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover to NR cell is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

$T_{search}$ is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then $T_{search}$ = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = N*T_{rs}$ ms. If the target cell is an unknown inter-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = 3* N*T_{rs}$ ms. Regardless of whether DRX is in use by the UE, $T_{search}$ shall still be based on non-DRX target cell search times.

For UE with one or multiple omni-directional antenna(s), N = 1;

For UE with the antenna array,

- When network assistance on ATG cells reference location of the target cell is provided to UE, N = 2;
- Otherwise, N = 4.

$T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$ for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20ms.

$T_{margin}$ is time for SSB post-processing. $T_{margin}$ can be up to 2ms.

$T_{IU}$ is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. $T_{IU}$ can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$T_{rs}$ is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise $T_{rs}$ is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$=5ms assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the handover command, $T_{rs}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in Clause 9.2D.5 for intra-frequency handover and Clause 9.3D.4 for inter-frequency handover.

The normative reference for this requirement is TS 38.133 [6] clause 6.1E.1.2.

## 19.2.1.1 Intra-frequency handover from FR1 to FR1; known target cell

Editor's Note: This test case is incomplete for the following configurations:

- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

### 19.2.1.1.1 Test purpose

To verify the NR ATG UE's ability to perform NR FR1-NR FR1 intra frequency handover for ATG in RRC_CONNECTED state by meeting the delay requirement and interruption length for handover to known target cell.

### 19.2.1.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

### 19.2.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.1.1.

### 19.2.1.1.4 Test description

#### 19.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

This test shall be tested using any of the test configurations in Table 19.2.1.1.4.1-1.

**Table 19.2.1.1.4.1-1: Intra-frequency handover from FR1 to FR1 test configurations**

### 19.2.1.1.4.2 Test procedure

The test scenario comprises of one NR carrier and two cells as given in tables 19.2.1.1.4.1-3 and 19.2.1.1.5-1. No gap patterns are configured in the test case. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send measurement report A3. An RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message. Cell 1 is the active cell.

2. Set the parameters according to T1 in Table 19.2.1.1.5-1. Propagation conditions are set according to Annex C clause C.2.2. T1 starts.

3. SS shall transmit an RRCReconfiguration message, configuring measurement object.

4. UE shall transmit RRCReconfigurationComplete message.

5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.1.1.5-1.

6. UE shall transmit a MeasurementReport message triggered by Event A3.

7. SS shall transmit the RRCReconfiguration message implying handover is sent to the UE, at that instant the SS shall switch the power settings from T2 to T3 as specified in Table 19.2.1.1.5-1. T3 starts.

8. If the UE transmits the uplink PRACH channel to Cell 2 less than 72 ms from the beginning of time period T3 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

9. The UE shall transmit *RRCReconfigurationComplete* message on Cell 2.

10. After T3 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.

11. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 3) mod1008) for next iteration of the test procedure loop.

12. Repeat steps 2-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall start to transmit the PRACH to Cell 2 less than 72 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{interrupt}$ = 62 ms in the test. $T_{interrupt}$ is defined in clause 19.2.1.0.1.

This gives a total of 72 ms.

### 19.2.1.2 Inter-frequency handover from FR1 to FR1; unknown target cell

Editor's Note: This test case is incomplete for the following configurations:

- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

#### 19.2.1.2.1 Test purpose

To verify the NR ATG UE's ability to perform NR FR1-NR FR1 inter frequency handover for ATG in RRC_CONNECTED state by meeting the delay requirement and interruption length for handover to unknown target cell.

#### 19.2.1.2.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

#### 19.2.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.1.2.

#### 19.2.1.2.4 Test description

##### 19.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

This test shall be tested using any of the test configurations in Table 19.2.1.2.4.1-1.

### 19.2.1.2.4.2 Test procedure

The test scenario comprises of two NR carriers and one cell on each carrier as given in tables 19.2.1.2.4.1-3 and 19.2.1.2.5-1. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1and T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and start to transmit the PRACH to Cell 2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message. Cell 1 is the active cell.
2. Set the parameters according to T1 in Table 19.2.1.2.5-1. Propagation conditions are set according to Annex C clause C.2.2. T1 starts.
3. SS shall transmit an RRCReconfiguration message implying handover to Cell 2.
4. The start of T2 is the instant when the last TTI containing the RRC reconfiguration message implying handover is sent to the UE, at that instant the SS shall switch the power settings from T1 to T2 as specified in Table 19.2.1.2.5-1. T2 starts.
5. If the UE transmits the uplink PRACH channel to Cell 2 less than 132 ms from the beginning of time period T2 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
6. The UE shall transmit *RRCReconfigurationComplete* message on Cell 2.
7. After T2 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.
8. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.
9. Repeat step 2-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall start to transmit the PRACH to Cell 2 less than 132 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{interrupt}$ = 122 ms in the test. $T_{interrupt}$ is defined in clause 6.1E.1.2.2.

This gives a total of 132 ms.

## 19.2.2 Conditional Handover for ATG

### 19.2.2.0 Minimum conformance requirements

#### 19.2.2.0.1 Minimum conformance requirements for NR FR1 – NR FR1 conditional handover

[TS 38.133, clause 6.1E.2.2.1]

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2]. UE shall start RRM measurement before the distance condition is met if the *condEventD1* is configured to UE, the distance condition is defined in clause 5.5.4 in TS 38.331[2]. When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{CHO}$ seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

Where:

$T_{RRC}$ is the RRC procedure delay defined in clause 12 in TS 38.331 [2].

$T_{Event_DU}$ is the delay uncertainty which is the time from when the UE successfully decodes a conditional handover command until a condition exists at the measurement reference point which will trigger the conditional handover.

$T_{measure}$ is the measurements time stated in TS 38.133 [6] clause 6.1E.2.2.2.

$T_{CHO_execution}$ is the conditional execution preparation time in TS 38.133 [6] clause 6.1E.2.2.3.

$T_{interrupt}$ is the interruption time stated in TS 38.133 [6] clause 6.1E.2.2.4.

The conditional handover delay requirements are applied if both condition D1-1 and condition D1-2 are fulfilled before the end of $T_{measure}$ for location-based CHO, otherwise no CHO requirement is applied.

[TS 38.133, clause 6.1E.2.2.2]

The measurement time delay is defined from the end of $T_{Event_DU}$ until UE executes a handover to a target cell and interruption time starts.

For intra-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify_intra_without_index}$ defined in TS 38.133 [6] clause 9.2D.5.1 or clause 9.2D.6.2.

For location-based conditional intra-frequency handover:

- If both condition D1-1 and condition D1-2 are fulfilled earlier than $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, then the measurement time delay equal to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ assuming UE only performs measurements within SMTC window of the target cell.
- If both condition D1-1 and condition D1-2 are fulfilled is later than $T_{Event_DU}$ plus $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ for intra-frequency handover, then the measurement time delay equal to the time from the end of $T_{event_DU}$ until time when both condition D1-1 and condition D1-2 are fulfilled.

For inter-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$ defined in TS 38.133 [6] clause 9.3D.4.

For location-based conditional inter-frequency handover,

- If both condition D1-1 and condition D1-2 are fulfilled earlier than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, then the measurement time delay equal to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$, assuming that the UE uses only the SMTC window of the target inter-frequency carrier for performing the measurements.
- If both condition D1-1 and condition D1-2 are fulfilled later than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, then the measurement time delay equal to the time from the end of $T_{event_DU}$ until time of both condition D1-1 and condition D1-2 are fulfilled.

When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency handover. If a cell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency handover becomes undetectable for a period and then the cell becomes detectable again and triggers a handover, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

[TS 38.133, clause 6.1E.2.2.3]

$T_{CHO_execution}$ is the UE execution preparation time for conditional handover, and starts after UE realizes the condition of CHO is met and identity of the target cell is determined. $T_{CHO_execution}$ can be up to 10ms.

[TS 38.133, clause 6.1E.2.2.4]

The interruption time is the time between when the UE starts to execute the conditional handover to the target cell and the time the UE starts transmission of the new PRACH.

For intra-frequency or inter-frequency conditional conditional handover, the interruption time shall be less than

$$T_{interrupt} = T_{processing} + T_{IU} + T_{\Delta} + T_{margin}\ \text{ms}$$

Where:

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20ms.

$T_{IU}$ is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. $T_{IU}$ can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3]

$T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$.

$T_{margin}$ is time for SSB post-processing. $T_{margin}$ can be up to 2ms.

$T_{rs}$ is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise Trs is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$=5ms assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the handover command, $T_{rs}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

NOTE 1: The actual value of $T_{IU}$ shall depend upon the PRACH configuration used in the target cell.

The normative reference for this requirement is TS 38.133 [6] clause 6.1E.2.2.

## 19.2.2.1 Intra-frequency distance-based conditional Handover from FR1 to FR1

Editor's Note: This test case is incomplete for the following configurations:

- TT analysis is missing.

### 19.2.2.1.1 Test purpose

### 19.2.2.1.4.2 Test procedure

The test scenario comprises of 2 NR carrier and two cells, Cell 1 and Cell 2, on each carrier respectively. General parameters and Cell-specific parameters for Cell 1 and Cell 2 are given in Table 19.2.2.1.4.1-3 and 19.2.2.1.5-1 respectively. Measurement gap (gap pattern #0) is configured in the test case.

The test consists of two successive time periods, with time durations of T1 and T2 respectively.

Time interval T1 needs to start immediately after the UE position and moving speed are configured via AT commands. The UE is configured to measure intra-frequency neighbour cell. The RRC message implying distance-based handover to Cell 2 with Event D1 shall be sent to UE, at a time earlier than $T_{RRC}$ (10ms) before the beginning of T2. where

- $T_{RRC}$ = 10ms, is the RRC procedure delay defined in clause 12 in TS 38.331 [13].

From start of T2, the Cell 2 becomes detectable and offset better than Cell 1 and location condition event condEventD1-r17 is is satisfied. During T2, the UE performs measurement on Cell 2 and evaluates the execution condition, and starts handover procedure when execution condition is satisifed. The UE shall sent PRACH to Cell 2 less than $T_{measure}$ + $T_{CHO_execution}$ + $T_{interrupt}$ ms from the start of T2. The Interruption length $T_{interrupt}$ shall also be verified in T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell. Set Cell 2 physical cell identity to the initial physical cell identity.

2. Set the parameters according to T1 in Table 19.2.2.1.5-1. Propagation conditions are set according to Annex C clause C.2.2. UE position and moving speed are configured on the UE via AT commands. Immediately after that, T1 starts. The SS starts continuously scheduling the UE to perform DL reception in every DL slot on Cell 1 and monitoring corresponding ACK/NACK feedbacks sent by the UE.

3. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008).

4. The SS shall transmit an *RRCReconfiguration* message with *conditionalReconfiguration* on Cell 1 to configure distanced-based CHO execution condition and measurement gap pattern #0 for the UE.

5. The UE shall transmit an *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.2.1.5-1. T2 starts.

7. If

   a) the UE transmits the PRACH preambles to Cell 2 less than $T_{measure}$ + $T_{CHO_execution}$ + $T_{interrupt}$ ms from the beginning of time period T2,

   and

   b) no longer than X consecutive ACK/NACK DTXs are observed by the SS from the start of T2 to the instant the UE transmits the first PRACH preamble, where

   - $X = T_{interrupt} + k_1$ for test configuration 19.2.2.1-1
   - $X = T_{interrupt}$ for test configuration 19.2.2.1-2
   - $X = 2 \cdot T_{interrupt}$ for test configuration 19.2.2.1-3.

   then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

8. After T2 expires, the SS sends an *RRCReconfiguration* with *reconfigurationWithSync* to cause UE handover back to Cell 1.

9. If UE is not in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1, switch off and on the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: 2412Hz is the maximum value of doppler with carrier frequency of 2170MHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.

| Note 5: | 5556Hz is the maximum value of doppler with carrier frequency of 5GHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation. |
|---|---|

The UE shall start to transmit the PRACH to Cell 2 less than 872 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay is defined in TS 38.133 [6] clause 6.1E.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay $T_{RRC}$ = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{Event_DU}$ = start of T2

At start of T2,

distance to source cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 15 - (-4600))^2}$ = 10057.8m, and D1-1 = 10000m

distance to target cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 15 - (14479))^2}$ = 9942.4m, and D1-2 = 10000m

i.e. D1-1 and D1-2 conditions are fulfilled at start of T2 with >=50m location margin.

$T_{measure}$ = max(600 + 200 ms, 0) = 800 ms;

$T_{interrupt}$ = 62ms; $T_{CHO_execution}$ = 10ms.

This gives a total of 800ms + 62ms + 10ms = 872 ms.

## 19.2.2.2 Inter-frequency distance-based conditional Handover from FR1 to FR1

Editor's Note: This test case is incomplete for the following configurations:

- TT analysis is missing.

### 19.2.2.2.1 Test purpose

To verify the requirememt for the NR FR1-NR FR1 inter-frequency distance-based conditional handover for ATG requirements specified in 38.133 [6] 6.1E.2.2.

### 19.2.2.2.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards and supporting distance-based conditional handover.

### 19.2.2.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.2.2.

### 19.2.2.2.4 Test description

#### 19.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

This test shall be tested using any of the test configurations in Table 19.2.2.2.4.1-1.

#### 19.2.2.2.4.2 Test procedure

The test scenario comprises of 2 NR carrier and two cells, Cell 1 and Cell 2, on each carrier respectively. General parameters and Cell-specific parameters for Cell 1 and Cell 2 are given in Table 19.2.2.2.4.1-3 and 19.2.2.2.5-1 respectively. Measurement gap (gap pattern #0) is configured in the test case.

The test consists of two successive time periods, with time durations of T1 and T2 respectively.

Time interval T1 needs to start immediately after the UE position and moving speed are configured via AT commands. During T1, the UE is configured to measure inter-frequency neighbour cell and Gap pattern ID gp0. The RRC message implying distance-based handover to Cell 2 with Event D1 shall be sent to UE, at a time earlier than $T_{RRC}$ (10ms) before the beginning of T2. where

- $T_{RRC}$ = 10ms, is the RRC procedure delay defined in clause 12 in TS 38.331 [13].

From start of T2, the Cell 2 becomes detectable and offset better than Cell 1 and after 9976ms of T2, location condition event condEventD1-r17 is satisfied. During T2, the UE performs measurement on Cell 2 and evaluates the execution condition, and starts handover procedure when execution condition is satisifed. The UE shall sent PRACH to Cell 2 less than $T_{measure} + T_{CHO_execution} + T_{interrupt}$ ms from the start of T2. The Interruption length $T_{interrupt}$ shall also be verified in T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell. Set Cell 2 physical cell identity to the initial physical cell identity.

2. Set the parameters according to T1 in Table 19.2.2.2.5-1. Propagation conditions are set according to Annex C clause C.2.2. UE position and moving speed are configured on the UE via AT commands. Immediately after that, T1 starts. The SS starts continuously scheduling the UE to perform DL reception in every DL slot on Cell 1 and monitoring corresponding ACK/NACK feedbacks sent by the UE.

3. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008).

4. The SS shall transmit an *RRCReconfiguration* message with *conditionalReconfiguration* on Cell 1 to configure distanced-based CHO execution condition and measurement gap pattern #0 for the UE.

5. The UE shall transmit an *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.2.2.5-1. T2 starts.

7. If

   c) the UE transmits the PRACH preambles to Cell 2 less than $T_{measure} + T_{CHO_execution} + T_{interrupt}$ ms from the beginning of time period T2,

   and

   d) no longer than X consecutive ACK/NACK DTXs are observed by the SS from the start of T2 to the instant the UE transmits the first PRACH preamble, where

   - $X = T_{interrupt} + k_1$ for test configuration 19.2.2.2-1
   - $X = T_{interrupt}$ for test configuration 19.2.2.2-2
   - $X = 2 \cdot T_{interrupt}$ for test configuration 19.2.2.2-3.

   then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

8. After T2 expires, the SS sends an *RRCReconfiguration* with *reconfigurationWithSync* to cause UE handover back to Cell 1.

9. If UE is not in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1, switch off and on the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: 2412Hz is the maximum value of doppler with carrier frequency of 2170MHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.
Note 5: 5556Hz is the maximum value of doppler with carrier frequency of 5GHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.

The UE shall start to transmit the PRACH to Cell 2 later than 9976 ms and less than 10048 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay is defined in clause 6.1E.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay $T_{RRC}$ = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{Event_DU}$ = start of T2

At 9976 ms after start of T2,

distance to source cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 14.976 - (-4600))^2}$ = 10050.2m, and D1-1 = 10000m

distance to target cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 14.976 - (14479))^2}$ = 9949.08m, and D1-2 = 10000m

i.e. D1-1 and D1-2 conditions are fulfilled at start of T2 with >=50m location margin.

$T_{measure}$ = max(600 + 200 ms, 9976 ms) = 9976 ms;

$T_{interrupt}$ = 62 ms; $T_{CHO_execution}$ = 10 ms.

This gives a total of 9976 ms + 62 ms + 10 ms = 10048 ms.

## 19.2.3.1 RRC re-establishment

### 19.2.3.1.0 Minimum conformance requirements

#### 19.2.3.1.1 Minimum conformance requirements for NR FR1 re-establishment

In RRC_CONNECTED state the UE shall be capable of sending *RRCReestablishmentRequest* message within $T_{re\text{-}establish_delay}$ seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ($T_{re\text{-}establish_delay}$) shall be less than:

$$T_{re-establish_delay} = T_{UE_re-establish_delay} + T_{UL_grant}$$

$T_{UL_grant}$: It is the time required to acquire and process uplink grant from the target PCell. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) is the time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) requirement shall be less than:

$$T_{UE_re-establish_delay} = 50\ \text{ms} + T_{identify_intra_NR} + \sum_{i=1}^{N_{freq}-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

The intra-frequency target NR cell shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clause 10.1.2 is fulfilled for a corresponding NR Band for FR1, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.X1 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.4 are fulfilled for a corresponding NR Band for FR1, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.X2 for a corresponding NR Band are fulfilled.

$T_{identify_intra_NR}$: It is the time to identify the target intra-frequency NR cell and it depends on whether the target NR cell is known cell or unknown cell. If the UE is not configured with intra-frequency NR carrier for RRC re-establishment then $T_{identify_intra_NR}$=0; otherwise $T_{identify_intra_NR}$ shall not exceed the values defined in Table 6.2D.1.2.1-1.

$T_{identify_inter_NR,i}$: It is the time to identify the target inter-frequency NR cell on inter-frequency carrier *i* configured for RRC re-establishment and it depends on whether the target NR cell is known cell or unknown cell. $T_{identify_inter_NR,i}$ shall not exceed the values defined in Table 6.2D.1.2.1-2.

$T_{SMTC}$: It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2*, $T_{smtc}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{SMTC,i}$: It is the periodicity of the SMTC occasion configured for the inter-frequency carrier *i*. If it is not configured, the UE may assume that the target SSB periodicity is no larger than 20 ms.

$T_{SI\text{-}NR}$: It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell.

$T_{PRACH:}$ It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. $T_{PRACH}$ can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$N_{freq}$: It is the total number of NR frequencies to be monitored for RRC re-establishment; $N_{freq}$ = 1 if the target intra-frequency NR cell is known, else $N_{freq}$ = 2 and $T_{identify_intra_NR}$ = 0 if the target inter-frequency NR cell is known.

There is no requirement if the target cell does not contain the UE context.

In the requirement defined in the below tables, the target FR1 cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown.

**Table 6.2D.1.2.1-1: Time to identify target NR cell for RRC connection re-establishment to NR intra-frequency cell**

| SSB Ês/Iot (dB) | cell | Known NR cell | Unknown NR cell |
|---|---|---|---|
| ≥ -8 | FR1 | MAX (200 ms, 5 x $T_{SMTC}$) | MAX (800 ms, 10 x $N1^{Note2}$ x $T_{SMTC}$) |
| < -8 | FR1 | N/A | $800^{Note1}$ |
| Note 1: The UE is not required to successfully identify a cell on any NR frequency layer when $T_{SMTC}$ > 20 ms and serving cell SSB Ês/Iot < -8 dB.<br>Note 2: For UEs with the antenna array, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>For UEs with one or multiple omni-directional antenna(s), N1 = 1. | | | |

**Table 6.2D.1.2.1-2: Time to identify target NR cell for RRC connection re-establishment to NR inter-frequency cell**

The normative reference for this requirement is TS 38.133 [6] clause 6.2D.1.

## 19.2.3.1.1 Intra-frequency RRC Re-establishment in FR1 for ATG

Editor's Note: This test case is incomplete for the following configurations:

- TT analysis is missing.
- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

### 19.2.3.1.1.1 Test purpose

To verify the NR ATG UE's ability to perform NR intra-frequency RRC re-establishment delay in FR1 with known target cell is within the specified limit for ATG.

### 19.2.3.1.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

### 19.2.3.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.3.1.0.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.3.1.1.

#### 19.2.3.1.1.4 Test description

##### 19.2.3.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

This test shall be tested using any of the test configurations in Table 19.2.3.1.1.4.1-1.

#### 19.2.3.1.1.4.2 Test procedure

The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message.
2. Set the parameters according to T1 in Table 19.2.3.1.1.5-1. T1 starts.
3. SS shall transmit an RRCReconfiguration message.
4. The UE shall transmit RRCReconfigurationComplete message.
5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.3.1.1.5-1. T2 starts
6. When T2 expires, the SS shall switch the power setting from T2 to T3 as specified in Table 19.2.3.1.1.5-1. T3 starts
7. If the UE starts to send PRACH preambles to cell 2 for sending the *RRCReestablishmentRequest* message to cell 2 within 1840 ms (= 220ms + 1.6 s) from the beginning of time period T2, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
8. After T3 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.
9. Repeat step 2-8 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The RRC re-establishment delay is defined as the time from the moment UE declares RLF, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to a known NR intra frequency cell shall be less than 1.6 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 1$

$T_{identify_intra_NR} = 200$ ms

$T_{SI} = 1280$ ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target intra-frequency NR cell.

$T_{PRACH} = 15$ ms; it is the additional delay caused by the random access procedure.

This gives a total of 1545 ms for RRC re-establishment delay, allow 1840 ms (240 ms + 1.6 s) from the beginning of T2 in the test case.

### 19.2.3.1.2 Inter-frequency RRC Re-establishment in FR1 with unknown target cell without serving cell timing for ATG

Editor's Note: This test case is incomplete for the following configurations:

- TT analysis is missing.
- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

#### 19.2.3.1.2.1 Test purpose

To verify the NR ATG UE's ability to perform NR inter-frequency RRC re-establishment delay in FR1 with unknown target cell and without serving cell timing are within the specified limits for ATG.

#### 19.2.3.1.2.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

#### 19.2.3.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.3.1.0.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.3.1.2.

#### 19.2.3.1.2.4 Test description

##### 19.2.3.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

This test shall be tested using any of the test configurations in Table 19.2.3.1.1.4.1-1.

### 19.2.3.1.2.4.2 Test procedure

The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, becomes inactive. The time period T3 starts after the occurrence of the radio link failure. During T1, the UE shall be configured with the carrier frequency of cell 2 (with RF Channel Number #2) to ensure that the UE has the context of the carrier frequency of cell 2 by the end of T1.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message.

2. Set the parameters according to T1 in Table 19.2.3.1.2.5-1. T1 starts.
3. SS shall transmit an RRCReconfiguration message.
4. The UE shall transmit RRCReconfigurationComplete message.
5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.3.1.2.5-1. T2 starts
6. When T2 expires, the SS shall switch the power setting from T2 to T3 as specified in Table 19.2.3.1.2.5-1. T3 starts
7. If the UE starts to send PRACH preambles to cell 2 for sending the *RRCReestablishmentRequest* message to cell 2 within 3 s from the beginning of time period T3, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
8. After T3 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.
9. Set cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.
10. Repeat step 2-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to an unknown NR inter frequency cell without serving cell timing shall be less than 3s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50\,ms + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq}$ = 2

$T_{identify_intra_NR}$ = 800 ms

$T_{identify_inter_NR}$ = 800 ms

$T_{SI}$ = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target inter-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 2945 ms, allow 3 s in the test case.

## 19.2.3.2

## 19.2.3.3 SA: RRC Connection Release with Redirection for ATG

### 19.2.3.3.0 Minimum conformance requirements

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR}$.

The time delay ($T_{connection_release_redirect_NR}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [13]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR}$) shall be less than:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH}$$

The target NR cell shall be considered detectable when for each relevant SSB, the following side conditions are met:

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.5 for a corresponding NR Band are fulfilled.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [13].

$T_{identify\text{-}NR}$: It is the time to identify the target NR cell and depends on the FR of the target NR cell. It is defined in Table 19.2.3.3.0-1. Note that $T_{identify\text{-}NR} = T_{PSS/SSS\text{-}sync} + T_{meas}$, in which $T_{PSS/SSS\text{-}sync}$ is the cell search time and $T_{meas}$ is the

measurement time due to cell selection criteria evaluation. $T_{SI-NR}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

$T_{RACH:}$ It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. $T_{RACH}$ can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in Table 8.1-1 of TS 38.213 [8].

$T_{rs}$ is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise $T_{rs}$ is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the *measObjectNR*s with the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, $T_{rs}$ is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with $T_{rs}$ = 20 ms if the SSB transmission periodicity is not larger than 20 ms; otherwise,
- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

**Table 19.2.3.3.0-1: Time to identify target NR cell for RRC connection release with redirection to NR**

| FR of target NR cell | $T_{identify-NR}$ |
|---|---|
| FR1 | MAX (680 ms, 11 x $N1^{Note2}$ x $T_{rs}$) |
| NOTE 1: If the UE has been provided with higher layer signalling of *smtc2* specified in TS 38.331 [13] prior to the redirection command, $T_{rs}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell. | |
| NOTE 2: For ATG UEs capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1. | |

### 19.2.3.3.1 NR SA FR1-FR1 RRC connection release with Redirection for ATG

Editor's Note: This test case is incomplete:

- MU/TT analysis is missing.
- Test applicability is missing.- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

#### 19.2.3.3.1.1 Test purpose

This test is to verify RRC connection release with redirection for ATG from NR to NR.

#### 19.2.3.3.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

#### 19.2.3.3.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 19.2.3.3.0.

The normative reference for this requirement is TS 38.133 [6] A.19.2.3.3.1.

#### 19.2.3.3.1.4 Test description

##### 19.2.3.3.1.4.1 Initial conditions

#### 19.2.3.3.1.4.2 Test procedure

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. The "*RRCRelease*" message shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2. Cell 1 and Cell 2 belong to different tracking areas.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.
2. Set the parameters according to T1 in Table19.2.3.3.1.5-1. T1 starts.
3. SS shall transmit an *RRCRelease* during period T1.
4. The SS shall switch the power setting from T1 to T2 as specified in Table19.2.3.3.1.5-1. When the last TTI containing the *RRCRelease* message is sent to UE, T2 starts.
5. If the UE transmits the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
6. After T2 expires, the UE shall be switched off. Then ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell and Cell 2 shall be powered OFF.
7. The SS shall set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.
8. Repeat step 2-7 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

For UEs that don't support *antennaArrayType-r1*8 and UEs that support *antennaArrayType-r18*:

The UE shall start to transmit the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to NR observed during repeated tests shall be at least 90%.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH},$$

where:

$T_{RRC_procedure_delay}$ = 110 ms in the test.

$T_{identify\text{-}NR}$ = 680 ms in the test.

$T_{SI\text{-}NR}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 38.331 [13] for the target NR cell.

$T_{RACH}$ = 170 ms in the test.

# 19.4 Signalling characteristics for ATG

## 19.4.1 Radio link monitoring for ATG

### 19.4.1.0 Minimum conformance requirements

#### 19.4.1.0.1 Minimum conformance requirements for SSB based RLM

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold $Q_{out_SSB}$ within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold $Q_{in_SSB}$ within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 19.4.1.0.1-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array,

- P value for an RLM-RS resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$

- $N_{total}$ / $N_{available}$ with $N_{available}$ > 0

  - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

  - $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and

  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W

  - $N_{available}$ is

    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

  - $T_{L1}$ is periodicity of the target RLM-RS

  - $P_{sharing\ factor}$ = 3.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 19.4.1.0.1-1: Evaluation period $T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ for FR1**

| Configuration | $T_{Evaluate_out_SSB}$ (ms) | $T_{Evaluate_in_SSB}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(10 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle≤320 ms | Max(200, Ceil(15 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 ms | Ceil(10 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

### 19.4.1.0.2 Minimum conformance requirements for CSI-RS based RLM

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS}$ within $T_{Evaluate_out_CSI\text{-}RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_CSI\text{-}RS}$ within $T_{Evaluate_in_CSI\text{-}RS}$ evaluation period.

- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 19.4.1.0.2-1 for FR1.

The requirements of $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and

- P = 1, when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array,

- P value for an RLM-RS resource to be measured is defined as

  $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ with $N_{available}$ = 0

  $N_{total}$ / $N_{available}$ with $N_{available}$ > 0

  - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of $M_{out}$ and $M_{in}$ used in table 19.4.1.0.2-1 are defined as:

- $M_{out} = 20$ and $M_{in} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

**Table 19.4.1.0.2-1: Evaluation period $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ for FR1**

| Configuration | $T_{Evaluate_out_CSI\text{-}RS}$ (ms) | $T_{Evaluate_in_CSI\text{-}RS}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out}$×P)×$T_{CSI\text{-}RS}$) | Max(100, Ceil($M_{in}$×P) × $T_{CSI\text{-}RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out}$×P)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) | Max(100, Ceil(1.5×$M_{in}$×P)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) |
| DRX > 320 ms | Ceil($M_{out}$×P) × $T_{DRX}$ | Ceil($M_{in}$×P) × $T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI\text{-}RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

## 19.4.1.1 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with SSB-based RLM RS in non-DRX mode

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT Command to set the UE speed and position is not specified in the test procedure
- The specific gNB reference location is missing in test procedure
- Antenna array is FFS

### 19.4.1.1.1 Test purpose

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell. This test will partly verify the FR1 radio link monitoring requirements in TS 38.133 [6] clause 8.1D.

### 19.4.1.1.2 Test applicability

This test applies to all types of NR ATG UE from release 18.

### 19.4.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.1.

#### 19.4.1.1.4 Test description

The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure 19.4.1.1.4-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. The UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40 ms) in test 1.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

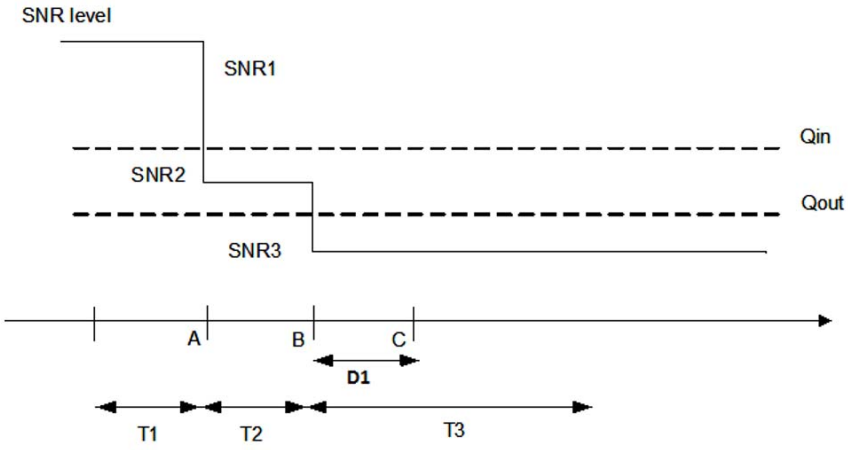

**Figure 19.4.1.1.4-1: SNR variation for out-of-sync testing**

#### 19.4.1.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.4.1.1.4.1-1

**Table 19.4.1.1.4.1-1: Supported test configurations**

| Configuration | Description |

The UE behaviour in each test during time durations T1, T2 and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The UE shall stop transmitting uplink signal no later than time point C (D1 second after the start of the time duration T3).

The rate of correct events observed during repeated tests shall be at least 90 % with the confidence level of 95%.

## 19.4.1.2 Radio Link Monitoring In-sync Test for FR1 PCell configured with SSB-based RLM RS in non-DRX mode

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT Command to set the UE speed and position is not specified in the test procedure
- The specific gNB reference location is missing in test procedure

Antenna array is FFS19.4.1.2.1 Test purpose

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell. This test will partly verify the FR1 radio link monitoring requirements in ts 38.133 [6] clause 8.1D.

### 19.4.1.2.2 Test applicability

This test applies to all types of NR UE from release 18 onwards.

### 19.4.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.2.

### 19.4.1.2.4 Test description

The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.19.4.1.2.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms.

## 19.4.1.3 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with CSI-RS-based RLM in non-DRX mode

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT Command to set the UE speed and position is not specified in the test procedure
- The specific gNB reference location is missing in test procedure
- Antenna array is FFS

### 19.4.1.3.1 Test purpose

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when no DRX is used. This test will partly verify the FR1 PCell CSI-RS Out-of-sync radio link monitoring requirements in TS 38.133 [6] clause 8.1D.

### 19.4.1.3.2 Test applicability

This test applies to all types of NR UE from release 18 onwards.

### 19.4.1.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.3.

### 19.4.1.3.4 Test description

The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure 19.4.1.3.4-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40 ms) in test. In the test, SSB0 is configured as the BFD-RS.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

The UE behaviour during time durations T1, T2, and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

The UE shall stop transmitting uplink signal in Cell 1 no later than time point C ($D_1$ ms after the start of the time duration T3) on the PCell.

The rate of correct events observed during repeated tests shall be at least 90 % with the confidence level of 95%.

## 19.4.1.4 Radio Link Monitoring In-sync Test for FR1 PCell configured with CSI-RS-based RLM RS in non-DRX mode

Editor's Note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT Command to set the UE speed and position is not specified in the test procedure
- The specific gNB reference location is missing in test procedure
- Antenna array is FFS

### 19.4.1.4.1 Test purpose

The purpose of this test is to verify that the UE properly detects the in sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when no DRX is used. This test will partly verify the FR1 PCell CSI-RS In-sync radio link monitoring requirements in TS 38.133 [6] clause 8.1D.

### 19.4.1.4.2 Test applicability

This test applies to all types of NR ATG UE from release 18 onwards.

### 19.4.1.4.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.4.

#### 19.4.1.4.4 Test description

The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure 19.4.1.4.4-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled. In the test, SSB0 is configured as the BFD-RS.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

# 19.5 Measurement procedure for ATG

## 19.5.1 Intra-frequency measurements

### 19.5.1.0 Minimum conformance requirements

TBD

### 19.5.1.1 SA FR1 event triggered reporting tests without gap without SSB index reading under non-DRX

Editor's Note: This test case is incomplete in following aspects:

TT analysis is missing.

Message contents are FFS

Test procedure is missing

AT Command to set the UE speed and position is not specified

The specific gNB reference location is missing

Antenna array is FFS

#### 19.5.1.1.1 Test purpose

The minimum conformance requirements are specified in clause TBD.

The normative reference for this requirement is TS 38.133 [6] clause A.19.5.1.1.

#### 19.5.1.1.4 Test description

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2. A measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

Editor's Note: This test case is incomplete in following aspects.

- Message content is missing
- Test procedure is missing
- Test requirements are missing
- TT analysis is missing
- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procrdures for providing network assistance on ATG cells reference locations are FFS.

#### 19.6.6.1.1.1 Test purpose

The purpose of this test is to verify that the CSI-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clauses 10.1.2.3.1 for CSI-RS intra-frequency measurements

#### 19.6.6.1.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based RSRP and RSRQ measurement.

#### 19.6.6.1.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 19.6.6.0.1

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

NOTE 3: CSI-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

NOTE 4: CSI-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Subtest 1 is not used when testing with 30 kHz SSB and CSI-RS SCS.
NOTE 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification

### 19.6.6.1.2 NR SA FR1 CSI-RSRP relative measurement accuracy for ATG

Editor's Note: This test case is incomplete in following aspects.

- Message content is missing
- Test procedure is missing
- Test requirements are missing
- TT analysis is missing
- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procrdures for providing network assistance on ATG cells reference locations are FFS.

#### 19.6.6.1.2.1 Test purpose

The purpose of this test is to verify that the CSI-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clauses 10.1.2.3.2 for CSI-RS intra-frequency measurements

#### 19.6.6.1.2.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based RSRP and RSRQ measurement.

#### 19.6.6.1.2.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 19.6.6.0.2

The normative reference for this requirement is TS 38.133 [6] clause A.19.6.6.1.

#### 19.6.6.1.2.1.4 Test description

#### 19.6.6.1.2.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.6.6.1.2.4.1-1.

**Table 19.6.6.1.2.4.1-1: Supported test configurations**

| Configuration | Description |
|---|---|
| 19.6.6.1.2-1 | NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, FDD duplex mode |

## 19.6.8 CSI-SINR for ATG

### 19.6.8.0 Minimum conformance requirements

#### 19.6.8.0.1 Intra-frequency CSI-SINR absolute accuracy requirements for ATG

Same as the minimum conformance requirements given in sub-clause 4.7.10.0.1.1.

#### 19.6.8.0.2 Inter-frequency CSI-SINR absolute accuracy requirements for ATG

Same as the minimum conformance requirements given in sub-clause 4.7.10.0.2.1.

#### 19.6.8.0.3 Inter-frequency CSI-SINR relative accuracy requirements for ATG

Same as the minimum conformance requirements given in sub-clause 4.7.10.0.2.2.

### 19.6.8.1 NR SA FR1 CSI-SINR absolute measurement accuracy for ATG

Editor's Note: This test case is incomplete in following aspects.

- Message content is missing
- Test procedure is missing
- Test requirements are missing
- TT analysis is missing
- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procrdures for providing network assistance on ATG cells reference locations are FFS.

#### 19.6.8.1.1 Test purpose

The purpose of this test is to verify that the CSI-SINR measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] sub-clause 10.1.12.2.1 for CSI-RS intra-frequency measurements.

#### 19.6.8.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based SINR measurements.

#### 19.6.8.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in Clause 19.6.8.0.1.

The normative reference for this requirement is in TS 38.133 [6] A.19.6.8.1.

#### 19.6.8.1.4 Test description

##### 19.6.8.1.4.1 Initial conditions

Supported test configuration are shown in Table 19.6.8.1.4.1-1.

**Table 19.6.8.1.4.1-1: Supported test configurations**

| Config | Description |
|---|---|
| 19.6.8.1-1 | NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, FDD duplex mode |
| 19.6.8.1-2 | NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, TDD duplex mode |
| 19.6.8.1-3 | NR 30 kHz SSB and CSI-RS SCS, 40 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to be tested in one of the supported test configurations. | |

Configure the test equipment and the DUT according to the parameters in Table 19.6.8.1.4.1-2.

1. Message contents are defined in Clause 19.6.8.1.4.3.
2. In this test case all cells are on the same carrier frequency. Cell 1 is the NR serving cell (PCell). Cell 2 is an NR FR1 cell in the same frequency as Cell 1. Cell 2 is the target cell for CSI-RSRQ measurements..
3. During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.
4. During the test, the specific gNB reference location is emulated by test system.

## A.1.6 PUSCH

This rule applies to NR cell(s), which the UE is connected to. The UE is in RRC_CONNECTED mode.

When signalling or data payloads are expected to be sent on the PUSCH, the UE may be provided in advance with PUSCH resources by the SS. For sake of simplicity, the PUSCH scheduling may also occur continuously over many consecutive subframes. These options shall not be used if:
1) stated otherwise in the test description, or
2) the transmission of PUSCH and UL scheduling information affects the test purpose (e.g. DRX, PUCCH reception etc.)

# A.1A Reference measurement channels under CCA

Note 1: Allocated outside the discovery burst transmission window in time and in resource blocks which do not overlap with the resource blocks allocated for SS/PBCH block.
Note 2: PDSCH is scheduled on the slots with RMSI.
Note 3: If necessary the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in TS 38.213 [8].
Note 4: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditonalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 2.
Note 5: PDSCH is not scheduled in slots containing SSB according to the SSB configuration used in the test. SSB configurations are defined in clause A.3A.
Note 6: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditonalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 1.
Note 7: PDSCH is transmitted during the RMC burst as specified in A.1A.5.

Note 1: DCI formats are defined in TS 38.212 [31].
Note 2: DCI format shall depend upon the test configuration.
Note 3: The offset is defined with respect to the subcarrier spacing of the CORESET from the smallest RB index of RMSI CORESET to the smallest RB index of the common RB overlapping with the first RB of the SS/PBCH block.
Note 4: The configuration of PDCCH monitoring occasions for RMSI CORESET is defined in Table 13-11 in TS 38.213 [8].
Note 5: Cell ID shall depend upon the test configuration.
Note 6: Payload size shall depend upon the test configuration.
Note 7: The configuration of set of resource blocks and slot symbols of control resource set for Type0-PDCCH search space corresponds to index 4 in Table 13-4A in TS 38.213 [8].
Note 8: Other values can be used to align with GSCN [13] as long as SSB does not overlap the RMC.

# A.1A.5 RMC burst transmission model

RMC not conveying RMSI is scheduled during the RMC burst. The length of the transmission burst in slots is defined as N. The burst transmission format is determined according to the steps below:

1. Select N randomly from a given set of the number of slots $S_1 = \{1,3,5\}$ with equal probability as the total length of RMC burst transmission format.

2. A uniform random variable from 0 to 1 is generated. If the random variable is less than $P_{CCA_DL}$, a burst of N fully occupied slots is transmitted. Otherwise, the RMC burst transmission is muted and the muting duration is the same as the number N of slots for determined burst format.

RMC burst transmission is scheduled outside discovery burst transmission window. If transmission occurred in the previous slot, transmission is muted for a duration of one slot. Additionally, if the start time of the candidate RMC burst transmission is within 5 slots of the start of the discovery burst transmission window, RMC transmission is not performed.

# A.2 Reference OCNG configuration

## A.2.1 Generic OFDMA channel noise generator (OCNG)

The OCNG pattern is used in a test for modelling the allocation of unused resourced in the channel bandwidth to virtual UEs (UEs that are not under test). The OCNG pattern simulates both PDCCH and PDSCH transmissions to the virtual UEs. For the cells operating under CCA, OCNG is transmitted only in slots with RMC burst transmission and is not transmitted during the slots for which CCA attempt is unsuccessful or during DBT windows.

# A.6 EN-DC test setup

The purpose of this Annex is to specify the EN-DC configuration for the test cases in Chapters 4 and 5 of this test specification.

## A.6.1 E-UTRA serving cell parameters

This clause defines the cell power levels and other specific cell parameters of the E-UTRA serving cell for EN-DC.

### A.6.1.1 E-UTRA serving cell parameters for EN-DC tests with NR FR1

Table A.6.1.1-1 defines the E-UTRA serving cell parameters for EN-DC tests with NR FR1 cell(s), defined in Chapter 4 of this test specification and for iRAT tests with E-UTRA serving cell and NR FR1 cell(s) defined in Chapter 8 of this test specification. Unless otherwise stated within the test, all measurements in Clauses 4 and 5 are performed only on the NR carrier. The E-UTRA PCell shall be configured to not interfere with NR operation and the E-UTRA PCell signal power shall not be critical to the test purpose.

## A.6.1.2 E-UTRA serving cell parameters for EN-DC tests with NR FR2

Table A.6.1.2-1 defines the E-UTRA serving cell parameters for EN-DC tests with NR FR2 cell(s), defined in Chapter 5 of this test specification and for iRAT tests with E-UTRA serving cell and NR FR1 cell(s) defined in Chapter 8 of this test specification. Unless otherwise stated within the test, all measurements in Clauses 5 and 7 are performed only on the NR carrier. The E-UTRA PCell shall configured to not interfere with NR operation and the E-UTRA PCell signal power shall not be critical to the test purpose.

# A.6A NR FR1-FR2 test setup

Some test cases in clause 7 have NR cells in both FR1 and FR2. Unless otherwise stated within the test, the NR FR1 Cell signal is required only to provide a link to the UE under test. The Test Equipment shall provide a stable and noise-free NR FR1 signal without need of precise propagation modelling, path loss and polarization control. Further details of the NR FR1 signal configuration are not defined as part of the cell specific test parameters, since the NR FR1 link is not under performance verification and is not expected to influence the test purpose.

# A.6B EN-DC test setup with unlicensed bands

## A.6B.1 E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) under CCA in FR1

Table A.6B.1-1 defines cell specific test parameters for E-UTRAN cell which can be used in EN-DC test cases or in any test case comprising at least one E-UTRA serving cell with all NR cells under CCA in FR1. Unless otherwise stated within the test, all measurements are performed only on the unlicensed NR carrier. The E-UTRA serving cell shall configured to not interfere with NR operation and the E-UTRA serving cell signal power shall not be critical to the test purpose.

Note 2: DL RMCs and OCNG patterns are specified in clauses A 3.1 and A 3.2 of TS 36.133 respectively.
Note 3: OCNG shall be used such that all cells are fully allocated, and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 4: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 5: $E_s/I_{ot}$, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

# A.7 Reference PRACH configurations

This clause provides the typical PRACH configurations used for all RRM test cases defined in this test specification. Parameters not listed in this clause can be derived from the configuration of each test.

## A.7.1 PRACH configurations for FR1

Table A.7.1-1 defines the PRACH configurations for FR1. Each of the PRACH configurations defined in Table A.7.1-1 have different applicabilities:

- PRACH.1 FR1 for SSB-based contention based random access in FR1.
- PRACH.2 FR1 for SSB-based non-contention based random access in FR1.
- PRACH.3 FR1 for CSI-RS based non-contention based random access in FR1.
- PRACH.4 FR1 for CSI-RS based non-contention based random access in FR1 to convey BFR.
- PRACH.6 FR1 for SSB-based contention free random access in FR1.

The PRACH configuration defined in Table A.7.1-2 has the following applicability:

- PRACH.5 FR1 for LTM early UL synchronization on candidate cell in FR1.

# A.7A Reference MsgA configurations

This clause provides the typical PRACH and PUSCH configurations for MsgA used for all RRM test cases defined in this test specification. Parameters not listed in this clause can be derived from the configuration of each test.

## A.7A.1 MsgA configurations for FR1

Table A.7A.1-1 defines the MsgA configurations for FR1. Each of the MsgA configurations defined in Table A.7A.1-1 have different applicabilities:

- MsgA.1 FR1 for SSB-based 2-step contention based random access in FR1.
- MsgA.2 FR1 for SSB-based 2-step non-contention based random access in FR1.

# A.8 Reference BWP configurations

This clause provides the typical BWP configurations used for RRM test cases defined in this test specification. For downlink BWP, both initial BWP and dedicated BWP configurations are specified in clause A.8.1 and for uplink BWP, dedicated BWP configurations are specified in clause A.8.2. Parameters not listed in this clause can be derived from the configuration of each test.

## A.8.1 Downlink BWP configurations

Table A.8.1-1 defines the different downlink initial BWP configurations. Table A.8.1-2 defines the different downlink dedicated BWP configurations.

**Table A.8.1-1: Downlink BWP patterns for initial BWP configuration**

| BWP Parameters | Unit | Values | | |

NOTE 1: $RB_b$ is the lowest PRB index to guarantee the BWP not fully overlapped with SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.
NOTE 2: $RB_a$ is the lowest PRB index to guarantee the BWP including SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.
NOTE 3: $RB_c$ is the PRB index having an offset of 6 PRBs with respect to the start of SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.

## A.8.2 Uplink BWP configurations

Table A.8.2-1 defines the uplink initial BWP configurations. Table A.8.2-2 defines the uplink dedicated BWP configurations.

**Table A.8.2-1: Uplink BWP patterns for initial BWP configurations**

| BWP Parameters | Values | |
|---|---|---|
| UL BWP | ULBWP.0.1 | ULBWP.0.2 |

NOTE 1: $RB_b$ is the lowest PRB index to guarantee the BWP not fully overlapped with SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.
NOTE 2: $RB_a$ is the lowest PRB index to guarantee the BWP including SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.
NOTE 3: $RB_c$ is the PRB index having an offset of 6 PRBs with respect to the start of SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.

# A.8A Reference BWP configurations for RedCap

This clause provides the typical BWP configurations used for RedCap RRM test cases defined in Annex A. RedCap downlink dedicated BWP configurations are specified in clause A.8A.1 and RedCap uplink dedicated BWP configurations are specified in clause A.8A.2. Other parameters not listed in this clause can be derived from the setup of each test.

# A.9 Angle of Arrival (AoA) for FR2 RRM test cases

This clause specifies the AoA setups for FR2 RRM test cases in clause 5 and 7. The applicable AoA setup is defined in each test case in clause 5 and 7.

## A.9.1 Setup 1: Single AoA in Rx beam peak direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, are aligned to the UE Rx beam peak direction (as defined in TS 38.101-2 [3]).

## A.9.2 Setup 2: Single AoA in non Rx beam peak direction

### A.9.2.1 Setup 2a: Single AoA in non Rx beam peak direction without change in direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, align to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The direction (AoA) of the signals shall not be changed between test iterations.

### A.9.2.2 Setup 2b: Single AoA in non Rx beam peak direction with change in direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, align to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. For UE power class 3, the direction (AoA) of the signals shall be changed for each test iteration (for UE power classes other than 3, this is FFS). Unless otherwise specified by the test case, the TE shall alternate between a minimum of 33 different AoAs. The minimum separation between AoAs used in consecutive iterations shall be 30° in great-circle distance.

NOTE: if it is not possible to find at least 33 different test points meeting the required criteria (FFS), the test shall alternate between all the available test points.

## A.9.3 Setup 3: 2 AoAs

There are 2 active probes in the test. The DL signals, and noise if applicable, transmitted from the two active probes, align to directions (AoAs) which are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The relative angular offset between the

directions (AoAs) of the 2 active probes, shall be changed for each test iteration. Unless otherwise specified by the test case, the TE shall alternate between a minimum of 33 different test points. A test point comprehends the relative angular offset between the active probes, and the AoA of each of the signals from the UE point of view. The relative angular offset between the active probes shall change for consecutive test points.

The applicable set of relative angular offsets between the 2 active probes is given in Table A.9.3-1 for each UE power class.

**Table A.9.3-1: Set of relative angular offsets between active probes for each power class**

| UE Power class | Relative angular offset between active probes |
|---|---|
| 1 | 30°, 60°, 90° and 120° |
| 2 | FFS |
| 3 | 30°, 60°, 90°, 120° and 150° |
| 4 | FFS |

NOTE: if it is not possible to find at least 33 different test points meeting the required criteria (that is, the two AoAs are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] and the angular offset between them corresponds to one of the offsets in Table A.9.3-1 for the corresponding UE power class), the test shall alternate between all the available test points.

## A.9.4 Setup 4: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak

### A.9.4.1 Setup 4a: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak without change in direction

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. One probe is aligned to the UE Rx beam peak direction as defined in TS 38.101-2 [3]. The second is aligned to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The direction (AoA) of the non Rx beam peak signal shall not be changed between test iterations.

### A.9.4.2 Setup 4b: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak with change in direction

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. One probe is aligned to the UE Rx beam peak direction as defined in TS 38.101-2 [3]. The second is aligned to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class.

For UE power class 3, the relative angular offset between the directions (AoAs) of the 2 active probes shall be changed for each test iteration, within the probe alignment described above. The applicable set of relative angular offsets between the 2 active probes is given in Table A.9.3-1 for each UE power class. Unless otherwise specified by the test case, the TE shall alternate between a minimum of 5 different test points. A test point comprehends the relative angular offset between the active probes, and the AoA of each of the signals from the UE point of view, one of them being the Rx beam peak direction. The relative angular offset between the active probes shall change for consecutive test points.

NOTE: if it is not possible to find at least 5 different test points meeting the required criteria (that is, the two AoAs are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] and the angular offset between them corresponds to one of the offsets in Table A.9.3-1 for the corresponding UE power class), the test shall alternate between all the available test points.

## A.9.5 Setup 5: 2 AoAs for simultaneous reception with QCL Type-D

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. The 2 AoAs (AoA1 and AoA2) for simultaneous reception with different QCL-typeD are from the set of AoA pairs, denoted by (AoA1, AoA2) that can support 2 AoA reception for UE declared AoA angular separation and declared

orientation in the positioner of the test system according to the spherical coverage requirement for simultaneous reception from multiple directions as defined in clause 7.3K.3 of TS 38.101-2 [3] for UE power class 3 supporting simultaneous reception from multiple directions. The angular separation between the directions (AoA1 and AoA2) of the 2 active probes is declared from Table 7.3K.3-1 in clause 7.3K.3 of TS 38.101-2 [3] and shall not be changed for each test iteration.

AoA1 needs to satisfy the spherical coverage requirement in Table 7.3.4.3-1 of TS 38.101-2 [3].

NOTE: The chosen AoA pair (AoA1, AoA2) is up to RAN5.

### A.9.6 Setup 6: 3 AoAs for simultaneous reception with different QCL Type-D

There are 3 active probes in the test and the DL signals and noise are transmitted from the three active probes.

Out of the three AoAs, one AoA (AoA1) is aligned to a direction which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for UE power class 3 and other 2 AoAs (AoA2 and AoA3) are from the set of AoA pairs, denoted by (AoA2, AoA3) that can support 2 AoA reception for UE declared AoA angular separation and declared orientation in the positioner of the test system according to the spherical coverage requirement for simultaneous reception from multiple directions as defined in clause 7.3K.3 of TS 38.101-2 [3] for power class 3 supporting simultaneous reception from multiple directions.

The angular offset between the directions of the AoA pair (AoA2, AoA3) is declared from Table 7.3K.3-1 in clause 7.3K.3 of TS 38.101-2 [3] and shall not be changed for each test iteration.

NOTE: The chosen AoA pair (AoA2, AoA3) is up to RAN5.

### A.9.7 Setup 7: 3 AoAs

There are 3 active probes in the test. The DL signals, and noise if applicable, transmitted from the three active probes, align to directions (AoAs) which are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The relative angular offset between the directions (AoAs) of the 3 active probes, shall be changed for each test iteration. Any combinations of two relative angular offsets between 2 active probes specified in Table A.9.3-1, is considered as a valid applicable relative angular offsets between 3 active probes for the respective power class.

## A.10 TCI State Configuration

### A.10.1 Introduction

This clause provides the configurations for TCI states towards either SSB or CSI-RS. The TCI states defined in this clause are configured in each test when applicable to indicate that certain DL signals are quasi-collocated with the referenceSignal configured in the TCI states.

### A.10.2 TCI states

# A.10A Unified TCI State Configuration

## A.10A.1 Introduction

This clause provides the configurations for unified TCI states towards either SSB or CSI-RS. The DLorJoint TCI states defined in this clause are configured in each test when applicable to indicate that certain DL (and UL, if joint DL/UL operation is configured) signals are QCL'ed with the referenceSignal configured in the TCI states. The UL TCI states defined in this clause are configured in each test when applicable to indicate that certain UL signals are QCL'ed with the referenceSignal configured in the TCI states.

# A.10B LTM Candidate TCI State Configuration

## A.10B.1 Introduction

This clause provides the configurations for TCI states of LTM candidate cell(s) towards either SSB or TRS. The LTM candidate DLorJoint TCI states defined in this clause are configured in each test when applicable to indicate that certain DL (and UL, if joint DL/UL operation is configured) signals are QCL'ed with the referenceSignal configured in the TCI states. The UL TCI states defined in this clause are configured in each test when applicable to indicate that certain UL signals are QCL'ed with the referenceSignal configured in the TCI states.

# A.19 Test Cases involving E-UTRA/FR1 and FR2 carriers

## A.19.1 Introduction

The following applies to UE when undergoing tests with a mix of E-UTRA/NR FR1 and NR FR2 carriers in clauses 5, 7 and 8.

## A.19.2 Principle of Testing in EN-DC

For test cases in clause 5 listed in Table A.19.2-1, the following applies:

- UE does not have to pass the test case.

**Table A.19.2-1: Test cases with the E-UTRA/FR1 – FR2 testability issue (EN-DC)**

| Clause | Test case slogan |
|---|---|
| 5.5.2.7 | E-UTRAN - NR FR2 interruptions at E-UTRA SRS carrier based switching |
| 5.5.3.6 | Multiple SCell Activation and deactivation of one unknown SCell and one known SCell in FR2 |
| 5.5.6.1.2 | EN-DC FR2 DCI-based DL active BWP switch with SCell in non-DRX in synchronous EN-DC |

## A.19.4 Principle of Testing in E-UTRA

For test cases in clause 8 listed in Table A.19.4-1, the following applies:

- UE does not have to pass the test case.

**Table A.19.4-1: Test cases with the E-UTRA/FR1 – FR2 testability issue (E-UTRA)**

| Clause | Test case slogan |
|---|---|

# Annex B (normative): Conditions for RRM requirements applicability for operating bands

## B.1 Conditions for NR RRC_IDLE state mobility

### B.1.1 Introduction

In Annex B.1, the following conditions are specified:

- UE conditions which shall apply for UE intra-frequency idle state mobility test cases in clauses 6.1 and 7.1,
- UE conditions which shall apply for UE inter-frequency idle state mobility test cases in clauses 6.1 and 7.1.
- UE conditions which shall apply for RedCap UE intra-frequency idle state mobility test cases in clauses 16.1 and 17.1.
- UE conditions which shall apply for RedCap UE inter-frequency idle state mobility test cases in clauses 16.1 and 17.1.

### B.1.2 Conditions for measurements on NR intra-frequency cells for cell re-selection

Editor's notes for Table B.1.2-2 (RAN4 dependant):

- The value of Y for power class 4 is FFS, where $Y_4$ is the rough/fine beam gain difference in Rx beam peak direction for power class 4
- The value of Z for power class 4 is FFS, where $Z_4$ is the rough/fine beam gain difference in spherical coverage directions for power class 4

This clause defines the following conditions for NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.1.2-1 for FR1 NR cells.

The conditions are defined in Table B.1.2-2 for FR2 NR cells.

**Table B.1.2-1: Conditions for intra-frequency cell re-selection in FR1**

| Parameter | NR operating band groups Note1 | Minimum SSB_RP | | SSB Ês/Iot |
|---|---|---|---|---|
| | | dBm / $SCS_{SSB}$ | | dB |

NOTE 1: Values based on EIS spherical coverage as defined in clause 7.3.4 of TS 38.101-2 [19]. Side condition applies for directions in which EIS spherical coverage requirement is met.
NOTE 2: Values specified at the Reference point to give minimum SSB Ês/Iot, with no applied noise.
NOTE 3: For UEs that support multiple FR2 bands, Rx Beam Peak values are increased by $\Delta MB_{P,n}$ and Spherical coverage values are increased by $\Delta MB_{S,n}$, the UE multi-band relaxation factor in dB specified in clause 6.2.1 of TS 38.101-2 [19].

## B.1.3 Conditions for measurements on NR inter-frequency cells for cell re-selection

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions defined in Table B.1.2-1 for FR1 NR intra-frequency cell re-selection shall also apply for FR1 NR inter-frequency cells in this clause.

The conditions defined in Table B.1.2-2 for FR2 NR intra-frequency cell re-selection shall also apply for FR2 NR inter-frequency cells in this clause.

## B.1.4 Conditions for measurements on NR intra-frequency cells for cell re-selection for RedCap

This clause defines the following conditions for RedCap NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.1.4-1 and Table B.1.4-2 for 1 Rx and 2 Rx RedCap respectively for FR1 NR cells.

The conditions are defined in Table B.1.4-3 for FR2 NR cells.

**Table B.1.4-1: Conditions for intra-frequency cell re-selection in FR1 for RedCap for 2Rx**

## B.1.5 Conditions for measurements on NR inter-frequency cells for cell re-selection for RedCap

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions defined in Table B.1.4-1 and Table B.1.4-2 for 1 Rx and 2 Rx RedCap respectively for FR1 RedCap NR intra-frequency cell re-selection shall also apply for FR1 RedCap NR inter-frequency cells in this clause.

The conditions defined in Table B.1.4-3 for FR2 RedCap NR intra-frequency cell re-selection shall also apply for FR2 RedCap NR inter-frequency cells in this clause.

## B.1.6 Conditions for measurements on NR intra-frequency cells for cell re-selection for satellite access

This clause defines the following conditions for NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band for satellite access.

The conditions are defined in Table B.1.6-1 for FR1 NR cells.

## B.1.7 Conditions for measurements on NR inter-frequency cells for cell re-selection for satellite access

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band for satellite access.

The conditions defined in Table B.1.6-1 for FR1 NR intra-frequency cell re-selection for satellite access shall also apply for FR1 NR inter-frequency cells for satellite access in this clause.

## B.1.8 Conditions for measurements on NR intra-frequency cells for cell re-selection under CCA

This clause defines the following conditions for NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.1.8-1 for FR1 NR cells under CCA.

### B.1.9 Conditions for measurements on NR inter-frequency cells for cell re-selection under CCA

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions defined in Table B.1.8-1 for FR1 NR intra-frequency cells under CCA shall also apply to FR1 NR inter-frequency cells under CCA in this clause.

## B.2 Conditions for NR RRC_CONNECTED state

### B.2.1 Introduction

In Annex B.2, the following conditions are specified:

- UE conditions which shall apply for UE intra-frequency measurement procedures and measurement performance tests in clauses 4.6, 4.7, 5.6, 5.7, 6.6, 6.7, 7.6 and 7.7,

  UE conditions which shall apply for UE inter-frequency measurements procedures and requirements in Clause 9,

- UE conditions which shall apply for UE intra-frequency measurements performance requirements in Clause 10,

- UE conditions which shall apply for UE inter-frequency measurements performance requirements in Clause 10.

### B.2.2 Conditions for NR intra-frequency measurements

Editor's notes for Table B.2.2-2 (RAN4 dependant):

- The value of Y for power class 4 is FFS, where $Y_4$ is the rough/fine beam gain difference in Rx beam peak direction for power class 4

- The value of Z for power class 4 is FFS, where $Z_4$ is the rough/fine beam gain difference in spherical coverage directions for power class 4

This clause defines the following conditions for NR intra-frequency measurements and corresponding procedures performed based on SSBs: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.2.2-1 for FR1 NR cells.

The conditions are defined in Table B.2.2-2 for FR2 NR cells.

## B.2.5 Conditions for RRC connection release with redirection to NR

Editor's notes for Table B.2.5.2-2:

- The value of Y for power class 4 is FFS, where $Y_4$ is the rough/fine beam gain difference in Rx beam peak direction for power class 4

- The value of Z for power class 4 is FFS, where $Z_4$ is the rough/fine beam gain difference in spherical coverage directions for power class 4

This clause defines the following conditions for RRC connection release with redirection to NR: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.2.5-1 for FR1 NR cells.

The conditions are defined in Table B.2.5-2 for FR2 NR cells.

# B.2.6 Conditions for UE transmit timing

## B.2.6.1 Conditions for SSB based UE transmit timing

Editor's notes for Table B.2.6.1-2:

- The value of Y for power class 4 is FFS, where $Y_4$ is the rough/fine beam gain difference in Rx beam peak direction for power class 4

- The value of Z for power class 4 is FFS, where $Z_4$ is the rough/fine beam gain difference in spherical coverage directions for power class 4

This clause defines the following conditions for UE transmit timing adjustment performed based on SSBs: SSB_RP and SSB Ês/Iot and applicable for a corresponding operating band.

The conditions are defined in Table B.2.6.1-1 for FR1 SSB.

## B.2.20 Conditions for RRC connection release with redirection to NR for satellite access

This clause defines the following conditions for RRC connection release with redirection to NR: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band for satellite access.

The conditions are defined in Table B.2.20-1 for FR1 NR cells.

**Table B.2.20-1: Conditions for RRC connection release with redirection to NR in FR1 for satellite access**

# B.3 RRM requirement exceptions

## B.3.1 Introduction

Annex B.3 covers exceptions for the side conditions based on receiver sensitivity for CA, DC, and SUL.

## B.3.2 Receiver sensitivity relaxation for CA

### B.3.2.1 Receiver sensitivity relaxation for UE supporting CA in FR1

For a UE supporting inter-band carrier aggregation configuration with uplink in NR band, if there is a relaxation of receiver sensitivity $\Delta R_{IB,c}$>0 dB as defined in TS 38.101-1 [18, Clause 7.3A.3], the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB,c}$ defined for the corresponding downlink NR bands.

For a UE supporting CA configuration in FR1, the requirement in this clause applies for both SC and CA operation.

## B.3.2.2 Receiver sensitivity relaxation for UE configured with CA in FR1

### B.3.2.2.1 Inter-band carrier aggregation

For a UE configured with inter-band carrier aggregation with active uplink in NR band, if there is a relaxation of receiver sensitivity $\Delta R_{IB,c}$>0 dB as defined in TS 38.101-1, Clause 7.3A.3 [2], the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB,c}$ defined for the corresponding downlink NR bands.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.2.1 should not be applied.

### B.3.2.2.2 Reference sensitivity exceptions due to UL harmonic interference for CA

In this clause, requirements exceptions are described for the UE configured with a band in FR1 when it is impacted by UL harmonic interference from another band in FR1 of the same CA configuration.

A relevant side condition (SSB_RP and Io) in a requirement shall be increased by the amount Δ=L2-L1, where L1 is the reference sensitivity level specified in TS 38.101-1 [2], Clause 7.3.2, and L2 is the reference sensitivity level based on the requirements in TS 38.101-1 [2], Clause 7.3A.4, when the following conditions are fulfilled,

- corresponding downlink component carriers on different NR bands are configured with CA and active,
- the uplink is configured in the NR low operating band and is active,
- the uplink configuration is as specified in TS 38.101-1 [2], Clause 7.3A.4, and
- the exception requirements specified in TS 38.101-1 [2], Clause 7.3A.4 apply.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.2.1 should not be applied.

### B.3.2.2.3 Reference sensitivity exceptions due to intermodulation interference due to 2UL CA

In this clause, requirements exceptions are described for the UE with an inter-band carrier aggregation with uplink assigned to two NR bands.

A relevant side condition (SSB_RP and Io) in a requirement shall be increased by the amount Δ=L2-L1, where L1 is the reference sensitivity level specified in TS 38.101-1 [2], Clause 7.3.2, and L2 is the reference sensitivity level based on the requirements in TS 38.101-1 [2], Clause 7.3A.5, when the following conditions are fulfilled,

- corresponding downlink component carriers on different bands are configured with CA and active,
- uplinks are assigned to two NR bands,
- the exception requirements specified in TS 38.101-1 [2], Clause 7.3A.5 apply.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.2.1 should not be applied.

## B.3.2.3 Receiver sensitivity relaxation for UE supporting CA in FR2

Editor's note: TBD

## B.3.2.4 Receiver sensitivity relaxation for UE configured with CA in FR2

### B.3.2.4.1 Intra-band contiguous carrier aggregation

For a UE configured with intra-band contiguous carrier aggregation in NR band in FR2, if there is a relaxation of receiver sensitivity $\Delta R_{IB}$>0 dB as defined in TS 38.101-2 [3], Clause 7.3A.2.1 depending on the aggregated channel bandwidth, the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB}$ defined for the corresponding downlink NR bands.

### B.3.2.4.2 Intra-band non-contiguous carrier aggregation

For a UE configured with intra-band non-contiguous carrier aggregation in NR band in FR2, if there is a relaxation of receiver sensitivity $\Delta R_{IB}$>0 dB as defined in TS 38.101-2 [3], Clause 7.3A.2.1 depending on the aggregated channel

bandwidth, the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB}$ defined for the corresponding downlink NR bands.

### B.3.3 Receiver sensitivity relaxation for DC

Editor's note: TBD

### B.3.4 Receiver sensitivity relaxation for SUL

#### B.3.4.1 Receiver sensitivity relaxation for UE supporting SUL in FR1

For a UE supporting a SUL configuration in FR1, if there is a relaxation of receiver sensitivity $\Delta R_{IB,c}>0$ dB as defined in TS 38.101-1 [2], Clause 7.3C.3, the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB,c}$ defined for the corresponding downlink NR bands.

For a UE supporting a SUL configuration in FR1, the requirement in this clause applies for both SC and SUL operation.

#### B.3.4.2 Receiver sensitivity relaxation for UE configured with SUL in FR1

##### B.3.4.2.1 Reference sensitivity exceptions due to UL harmonic interference for SUL

In this clause, requirements exceptions are described for the UE with a band in FR1 when it is impacted by UL harmonic interference from another band in FR1 of the same SUL configuration.

A relevant side condition (SSB_RP and Io) in a requirement shall be increased by the amount $\Delta$=L2-L1, where L1 is the reference sensitivity level specified in TS 38.101-1 [2], Clause 7.3.2, and L2 is the reference sensitivity level based on the requirements in TS 38.101-1 [2], Clause 7.3C.2, when the following conditions are fulfilled,

- a downlink component carrier is configured in NR band and is active,
- the uplink is configured in the NR low operating band and is active,
- the uplink configuration is as specified in TS 38.101-1 [2], Clause 7.3C.2, and
- the exception requirements specified in TS 38.101-1 [2], Clause 7.3C.2 apply.

If the relaxation $\Delta$ specified in this clause applies, then the relaxation specified in Clause B.3.4.1 should not be applied.

## B.4 Conditions for NR sidelink

### B.4.1 Test parameters for GNSS signals

This clause defines the reference signal power levels of generated satellites for a corresponding GNSS, which will be used in NR sidelink and satellite access test cases.

**Table B.4.1-1: GNSS Reference Signal Power Parameters**

| System | Parameters | Unit | Value |
|---|---|---|---|
| | Number of generated satellites per system | - | 6 |
| GPS[Note 1] | Reference signal power level for all satellites | dBm | -128.5 |
| Galileo | Reference signal power level for all satellites | dBm | -127 |
| GLONASS | Reference signal power level for all satellites | dBm | -131 |
| BDS | Reference signal power level for all satellites | dBm | -133 |
| NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on UE capabilities.<br>NOTE 2: The DUT UE does not need to support all systems. The DUT UE shall support at least one system and will be test for the supported systems. | | | |

### B.4.2 Conditions for PSBCH-RSRP Accuracy Requirements

This clause defines the following conditions for PSBCH-RSRP measurement accuracy requirements applicable for a corresponding operating band.

The conditions are defined in Table B.4.2-1 for FR1.

**Table B.4.2-1: Conditions for PSBCH-RSRP measurements in FR1**

| Parameter | NR sidelink operating band groups Note1 | Minimum S-SSB_RP | | | S-SSB Ês/Iot |
|---|---|---|---|---|---|

| | NR_TDD_FR1_J | -122.5 | -119.5 | -116.5 | |
| NOTE 1: NR sidelink operating band groups are as defined in Section 3A.4 for the corresponding NR operating bands. | | | | | |

## B.4.3 Conditions for Selection/Reselection to Intra-frequency SyncRef UE

This clause defines the S-SSB_RP and S-SSB Ês/Iot applicable for a corresponding operating band.

The conditions for selection/reselection to intra-frequency SyncRef UE are defined in Table B.4.3-1 for FR1.

**Table B.4.3-1: NR sidelink synchronization measurements in FR1**

| Parameter | NR sidelink operating band groups Note1 | Minimum S-SSB_RP | | | S-SSB Ês/Iot |
|---|---|---|---|---|---|
| | | dBm/SCS$_{S-SSB}$ | | | dB |

| | NR_TDD_FR1_J | -116.5 | -113.5 | -110.5 | ≥ 0 |
| NOTE 1: NR sidelink operating band groups are as defined in Section 3A.4 for the corresponding NR operating bands. | | | | | |

## B.4.4 Conditions for L1 SL-RSRP Accuracy Requirements

This clause defines the following conditions for L1 SL-RSRP measurement accuracy requirements applicable for a corresponding operating band.

The conditions are defined in Table B.4.4-1 for FR1.

**Table B.4.4-1: Conditions for L1 SL-RSRP measurements in FR1**

| Parameter | NR sidelink operating band groups Note1 | Minimum L1 SL-RSRP | | | Ês/Iot |
|---|---|---|---|---|---|

| | NR_TDD_FR1_J | -116.5 | -113.5 | -110.5 | |
| NOTE 1: NR sidelink operating band groups are as defined in Section 3A.4 for the corresponding NR operating bands.<br>NOTE 2: The parameter Ês/Iot is the Ês/Iot of PSCCH-DMRS and/or PSSCH-DMRS.<br>NOTE 3: The SCS is for PSCCH and/or PSSCH. | | | | | |

# B.5 High level test procedure for SAN RRM tests

The following high-level steps are conducted for test cases for SAN defined in clause 14.

- A set of ephemeris information are pre-defined for each satellite corresponding to different epoch times in TS 38.508-1 [14].

- The same ephemeris information will be maintained during the test (constant ephemerisInfo in all SIB19 updates) i.e., SAN RRM test cases are defined with fixed constant Delay and Doppler shift from satellite access node to UE unless otherwise stated.

- The range from which the selected constant Delay is selected is as follows:

  - For GSO an altitude of 35,786km is considered. The range of the one-way delay between UE and satellite is from 119.375ms to 128.79ms.

  - For NGSO an altitude of 600km and 1200km on a circular orbit are considered. The range of the one-way delay between UE and satellite is from 2ms (lowest value for LEO orbit 600km) to 6.67ms (highest value for LEO orbit 1200km).

- The constant Doppler shift (i.e. frequency offset) is derived from the same ephemeris (i.e., orbit emulation) as the Delay.

- UE location is determined for the test. The ephemeris and the UE location should be designed such that elevation angle relative to the UE position shall not be smaller than 30° during entire test time.

- Test equipment adjusts the time and frequency of transmission according to pre-defined ephemeris (constant in all SIB19 updates) and UE location.

# Annex C (normative): Downlink physical channels and propagation conditions

## C.1 Downlink physical channels

### C.1.1 General

The following clauses describe the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

### C.1.2 Default downlink signal levels

The downlink power settings in Table C.1.2-1 and Table C.1.2-2 are used unless otherwise specified in a test case for FR1 cell and FR2 cell, respectively. The downlink power settings in Table C.1.2-1 and Table C.1.2-2 are also used for the initial registration for NR /5GC test cases in clauses 6 and 7. For EN-DC test cases in clauses 4 and 5, the E-UTRA power settings used for initial registration are defined in Annex A.6.

For FR1, if the UE has more than one Rx antenna, the downlink signal is applied to each one. All UE Rx antennas shall be connected.

**Table C.1.2-1: Default Downlink power levels for NR (FR1)**

| SCS (kHz) | Parameter | Unit | Value | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Channel bandwidth | MHz | 3 | | 5 | 10 | 15 | 20 | 25 | 30 | 40 | 50 | 60 | 80 | 90 | 100 |

NOTE 1: The channel bandwidth powers are informative, based on -85dBm/15kHz SS/PBCH SSS EPRE, then scaled according to the number of RBs and rounded to the nearest integer dBm value. Full RE allocation with no boost or deboost is assumed.
NOTE 2: The power level is specified at each UE Rx antenna.
NOTE 3: DL level is applied for any of the Subcarrier Spacing configuration ( ) with the same power spectrum density of -85dBm/15kHz.

**Table C.1.2-2: Default Downlink power levels for NR (FR2)**

| SCS (kHz) | | Unit | Channel Bandwidth | | | |
|---|---|---|---|---|---|---|
| | | | 50 MHz | 100 MHz | 200 MHz | 400 MHz |
| 60 | Number of RBs | | 66 | 132 | 264 | N/A |
| | Channel BW power | dBm | -70 | -67 | -64 | N/A |
| 120 | Number of RBs | | 32 | 66 | 132 | 264 |

| | | | | | | |
|---|---|---|---|---|---|---|
| | SS/PBCH SSS EPRE | dBm/60kHz | -99 | -99 | -99 | -99 |
| NOTE 1: The channel bandwidth powers are informative, based on -99dBm/60kHz SS/PBCH SSS EPRE, then scaled according to the number of RBs and rounded to the nearest integer dBm value. Full RE allocation with no boost or deboost is assumed.<br>NOTE 2: The power level is specified at the centre of quiet zone.<br>NOTE 3: DL level is applied for any of the Subcarrier Spacing configuration ( $\mu$ ) with the same power spectrum density of –99dBm/60kHz. | | | | | | |

The default signal level uncertainty for FR1 is +/-3dB at each test port, for any level specified. The default signal level uncertainty for FR2 is +/-6dB at centre of quiet zone, for any level specified. If the uncertainty value is critical for the Test purpose, a tighter uncertainty is specified for the related test case in Annex F

## C.1.3 Default connection setup

Table C.1.3-1 describes the downlink physical channels that are required for NR connection setup. For EN-DC test cases in clauses 4 and 5, the required E-UTRA downlink physical channels are defined in TS 36.521-3 [26] Annex C.2.

**Table C.1.3-1: Downlink physical channels required for NR connection set-up**

| Physical Channel | EPRE Ratio | Note |
|---|---|---|
| **PBCH** | PBCH_RA = 0 dB | |
| | PBCH_RB = 0 dB | |
| **PSS** | PSS_RA = 0 dB | |
| **SSS** | SSS_RA = 0 dB | |

| **CSI-RS** | TBD | |
| NOTE 1: No boosting is applied | | |

As common PDSCH and PDCCH configuration parameters the parameters in Table A.1 and C.1.3-2 shall be used to bring up the connection setup for FR1 and FR2 NR cell.

**Table C.1.3-2: PDSCH and PDCCH configuration**

| Parameter | Unit | Value |
|---|---|---|
| Number of HARQ processes | | 8 (TDD)<br>16 (FDD) |
| Maximum number of HARQ transmission | | 5 |

# C.2 Propagation conditions

## C.2.0 General

The propagation conditions and channel models for various environments are specified. For each environment a propagation model is used to evaluate the propagation pathless due to the distance. Channel models are formed by combining delay profiles with a Doppler spectrum, with the addition of correlation properties in the case of a multi-antenna scenario.

## C.2.1 No interference

The downlink connection between the SS and the UE is without AWGN, and has no fading or multipath effects.

## C.2.2 Static propagation conditions

### C.2.2.0 General

The downlink connection between the SS and the UE is an AWGN environment (unless otherwise stated) with no fading or multipath effects.

### C.2.2.1 UE receiver with 2Rx antenna connectors

For 1 port transmission to UE receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}.$$

For 2 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{pmatrix} 1 & j \\ 1 & -j \end{pmatrix}$$

For 4 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & j & j \\ 1 & 1 & -j & -j \end{bmatrix}$$

### C.2.2.2 UE receiver with 4Rx antenna connectors

For 1 port transmission to UE receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}.$$

For 2 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & j \\ 1 & -j \\ 1 & j \\ 1 & -j \end{bmatrix}.$$

For 4 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & j & j \\ 1 & 1 & -j & -j \\ 1 & -1 & j & -j \\ 1 & -1 & -j & j \end{bmatrix}.$$

## C.2.3 Multi-path fading propagation conditions

Same as defined in TS 38.521-4 [20] clause B.2.

# Annex D (normative): Deviations from standard test configuration

## D.1 Test cases with different numerologies

TBD

## D.2 EN-DC test cases with different EN-DC configurations

### D.2.0 General

In clauses 4 and 5, EN-DC test cases may be defined for two component carriers (CCs) as well as for more than two CCs to verify the same RRM requirement.

### D.2.1 Principle of testing

If multiple EN-DC test cases are defined for two CCs as well as for more than two CCs to verify the same type of RRM requirement, and this requirement is dependent on the number of CCs, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the EN-DC test cases with the maximum number of CCs in EN-DC supported by the UE. Otherwise if the same type of RRM requirement is independent of the number of CCs then from the UE performance point of view the test coverage can be considered fulfilled by executing only the EN-DC test cases with two CCs in EN-DC supported by the UE.

*Editor's Note: The maximum number of CCs that can be used in FR2 tests in EN-DC would depend on the test equipment capability.*

## D.3 Carrier aggregation test cases with different CA configurations

### D.3.0 General

In clauses 6 and 7, carrier aggregation test cases may be defined for two CCs as well as for more than two CCs to verify the same RRM requirement.

### D.3.1 Principle of testing

If multiple carrier aggregation test cases are defined for two CCs as well as for more than two CCs to verify the same RRM requirement, and the test requirement is dependent on the number of CCs, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the CA test cases with the maximum number of CCs in CA supported by the UE. Otherwise if the same type of RRM requirement is independent of the number of CCs then from the UE performance point of view the test coverage can be considered fulfilled by executing only the CA test cases with at least two CCs in CA supported by the UE.

Editor's Note: The maximum number of CCs that can be used in FR2 tests in CA would depend on the test equipment capability.

## D.4 Antenna connection for 4Rx capable UEs

### D.4.0 General

All the tests in this test specification are defined for UEs supporting 2Rx. This clause explains how to apply the 2Rx tests in clauses 4 and 6 to UEs supporting 4Rx antenna ports. No tests are currently specified in clauses 4 or 6 which are

applicable only to 4Rx antenna ports, so 4Rx capable UEs are always tested by reusing tests which were originally specified for 2Rx UEs. Please notice that 4Rx is in general not supported for the test cases in clauses 5 and 7.

# D.4.1 Principle of testing

## D.4.1.1 Single carrier tests

For 4Rx capable UEs supporting at least one band where 2Rx is supported and 4Rx is not supported, all single carrier tests specified in clauses 4 and 6, except 4.7 and 6.7 shall be tested with 2Rx on any band where 2Rx is supported and 4Rx is not supported, with the antenna connection defined in D.4.2.1. Single carrier tests specified clauses 4.7 and 6.7 are band dependent and shall be tested in all bands supported by the UE, using 2Rx and the antenna connection defined in D.4.2.1 for the bands where 2Rx is supported and 4Rx is not supported, and the antenna connection defined in D.4.2.2 for the bands where 2Rx is not supported.

For 4Rx capable UEs that do not support any band where 2Rx is supported and 4Rx is not supported, all single carrier tests in clauses 4 and 6 shall be tested with 4Rx using the antenna configuration defined in D.4.2.2.For radio link monitoring tests, the SNR levels are modified according to table D.4.1.1-1 and table D.4.1.1-2

### D.4.1.2 Carrier aggregation tests

For carrier aggregation tests, the antenna connection is selected independently for each cell, the PCell and the SCell(s). If a cell (either PCell or any of the SCell(s)) is on a band where 2Rx is supported and 4Rx is not supported, antenna connection in Clause D.4.2.1 shall be used for this cell. If the cell is on a band where 2Rx is not supported, antenna connection in clause D.4.2.2 shall be used for this cell.

### D.4.1.3 EN-DC tests

For all EN-DC tests, the antenna connection is selected independently for each cell. For the E-UTRA PCell, the antenna connection specified in D.4.2.3 shall be used if the PCell is on an E-UTRA band where 2Rx is supported and 4Rx is not supported, and the antenna connection specified in D.4.2.4 shall be used if the PCell is on an E-UTRA band not supporting 2Rx.

For the NR PSCell and SCell(s), the principle of testing is the same as in D.4.1.2.

## D.4.2 Antenna connection

### D.4.2.1 Antenna connection for NR bands where 2Rx is supported

For NR bands where 2Rx is supported and 4Rx is not supported, the UE shall decide via manufacturer declaration and antenna port configuration which 2 of the 4 antenna ports shall be connected with the downlink signal from the SS. The remaining 2 antenna ports shall be connected to zero input. The parameters and test requirements remain unmodified.

### D.4.2.2 Antenna connection for NR bands where only 4Rx is supported

For NR bands where only 4Rx is supported, all 4Rx antenna ports shall be connected to the downlink signal from the SS. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring tests specified in D.4.1.1 and D.4.1.2, the parameters and test requirements remain unmodified.

### D.4.2.3 Antenna connection for E-UTRA bands where 2Rx is supported

For E-UTRAN bands where 2Rx is supported and 4Rx is not supported, the UE shall decide via manufacturer declaration and antenna port configuration which 2 of the 4 antenna ports shall be connected with the downlink signal from the SS. The remaining 2Rx antenna ports shall be connected to zero input. The parameters and test requirements remain unmodified.

### D.4.2.4 Antenna connection for E-UTRA bands where only 4Rx is supported

For E-UTRAN bands where only 4Rx is supported, all 4Rx antenna ports shall be connected to the downlink signal from the SS. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring tests specified in TS 36.521-1 [26] clause 3A.4.1.2.1 and 3A.4.1.2.2, the parameters and test requirements remain unmodified.

## D.4A Antenna configurations with unlicensed bands for 4Rx capable UEs

### D.4A.1 Introduction

All tests in clauses 10, 11, 12 and 13 are specified for UEs supporting 2RX. In this clause, the antenna connection method for applying 2RX tests to UEs supporting 4RX antenna ports is specified. No tests are currently specified in clauses 10, 11, 12 or 13 which are applicable only to 4RX antenna ports, so 4RX capable UEs are always tested by reusing tests which were originally specified for 2RX UEs.

### D.4A.2 Principle of Testing

#### D.4A.2.1 Single Carrier Tests

For 4RX capable UEs supporting at least one 2RX band, the, all single carrier tests specified in clauses 10, 11, 12 and 13 except those in 10.5, 11.6, 12.5 and 13.4, shall be tested on any band where 2RX is supported with the antenna connection specified in D.4A.2.4. For single carrier tests specified in clauses 10.5, 11.6, 12.5 or 13.4, all tests shall be tested with the antenna connection specified in D.4A.2.4 for bands where 2RX is supported, and the antenna connection specified in D.4A.2.5 for bands where 4RX is supported.

For 4RX capable UEs which do not support any 2RX band, all tests specified in clauses 10, 11, 12 and 13 shall be tested using the antenna connection specified in clause D.4A.2.5. For radio link monitoring tests, the SNR levels are modified according to table D.4A.2.1-1 and table D.4A.2.1-2.

### D.4A.2.2 Carrier Aggregation Tests

All carrier aggregation tests are performed using the antenna connection in clause D.4A.2.4 for the PCell antenna connection if the PCell is on a band where 2RX is supported or the antenna connection in D.4A.2.5 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All carrier aggregation tests are performed using the antenna connection in clause D.4A.2.4 for the SCell antenna connection if an SCell is on band where 2RX is supported or the testing procedure in D.4A.2.5 for the SCell antenna connection if an SCell is on a band where 4RX is supported.

### D.4A.2.3 EN-DC Tests

All EN-DC tests are performed using the antenna connection in clause D.4A.2.6 for the PCell antenna connection if the PCell is on a band where 2RX is supported or the antenna connection in D.4A.2.7 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All EN-DC tests are performed using the antenna connection in clause D.4A.2.4 for the PSCell or SCell antenna connection if an SCell is on band where 2RX is supported or the testing procedure in D.4A.2.5 for the SCell antenna connection if an SCell or PSCell is on a band where 4RX is supported.

### D.4A.2.4 Antenna connection for bands where 2RX is supported

For bands where 2RX is supported, it is left to the UE declaration and AP configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 Rx ports shall be connected with zero input**.** No test parameters or requirements are modified.

### D.4A.2.5 Antenna connection for bands where 4RX is supported

For bands where 4RX is supported, all 4 RX antennas are connected with data source from system simulator**.** The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clauses D.4A.2.1 and D.4A.2.2, no test parameters or requirements are modified.

### D.4A.2.6 EN-DC LTE Antenna connection for bands where 2RX is supported

For bands where LTE 2RX is supported, it is left to the UE declaration and AP configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 Rx ports shall be connected with zero input**.** No test parameters or requirements are modified.

### D.4A.2.7 EN-DC LTE Antenna connection for bands where 4RX is supported

For bands where LTE 4RX is supported, all 4 RX antennas are connected with data source from system simulator**.** The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clauses A.3.8.1.2.1 and A.3.8.1.2.2 of TS 36.133 [23], no test parameters or requirements are modified.

## D.4B Antenna connection for 8Rx capable UEs

### D.4B.1 Introduction

All tests in clause 4 and 6 are specified for UEs supporting 2Rx. In this clause, the antenna connection method for applying 2Rx tests or 4Rx tests to UEs supporting 8Rx antenna ports is specified. No tests are currently specified in clause 4 or 6 which are applicable only to 8Rx antenna ports, so 8Rx capable UEs are always tested by reusing tests which were originally specified for 2Rx UEs or 4Rx UEs.

# D.4B.1 Principle of testing

## D.4B.1.1 Single carrier tests

For 8Rx capable UEs supporting at least one band where 2Rx is supported and either 4Rx or 8Rx is not supported, all single carrier tests specified in clause 4 and 6 except those in clause 4.7 and 6.7 shall be tested on any band where 2Rx is supported and 8Rx is not supported with the antenna connection specified in clause D.4B.2.1. For single carrier tests specified in clause 4.7 or 6.7, all tests shall be tested with the antenna connection specified in clause D.4B.2.1 for bands where 2Rx is supported and 8Rx is not supported, and the antenna connection specified in clause D.4B.2.3 for bands where 8Rx is supported.

For 8Rx capable UEs supporting at least one band where 4Rx is supported and 8Rx is not supported but without supporting any band where only 2Rx is supported, all single carrier tests specified in clause 4 and 6 except those in clause 4.7 and 6.7 shall be tested on any band where 4Rx is supported and 8Rx is not supported with the antenna connection specified in clause D.4B.2.2. For single carrier tests specified in clause 4.7 or 6.7, all tests shall be tested with the antenna connection specified in clause D.4B.2.2 for bands where 4Rx is supported and 8Rx is not supported, and the antenna connection specified in D.4B.2.3 for bands where 8Rx is supported. For radio link monitoring tests, the SNR levels are modified according to Table D.4.1.1-1 and Table D.4.1.1-2. For beam failure detection and link recovery tests, the SNR levels are modified according to Table D.4.1.1-3.

For 8Rx capable UEs which do not support any band where 8Rx is not supported, all tests specified in clauses A.4 and A.6 shall be tested using the antenna connection specified in clause D.4B.2.3. For radio link monitoring tests, the SNR levels are modified according to Table D.4.1.1-1 and Table D.4.1.1-2. For beam failure detection and link recovery tests, the SNR levels are modified according to Table D.4.1.1-3.

## D.4B.1.2 Carrier aggregation tests

All carrier aggregation tests are performed using the antenna connection in clause D.4B.2.1 for the PCell antenna connection if the PCell is on a band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using the antenna connection in clause D.4B.2.2 for the PCell antenna connection if the PCell is on a band where 4Rx is supported and 8Rx is not supported, or using the antenna connection in D.4B.2.3 for the PCell antenna connection if the PCell is on a band where 8Rx is supported.

All carrier aggregation tests are performed using the antenna connection in clause D.4B.2.1 for the SCell antenna connection if an SCell is on band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using the antenna connection in clause D.4B.2.2 for the SCell antenna connection if an SCell is on a band where 4Rx is supported and 8Rx is not supported, or using the antenna connection in clause D.4B.2.3 for the SCell antenna connection if an SCell is on a band where 8Rx is supported.

## D.4B.1.3 EN-DC tests

All EN-DC tests are performed using the antenna connection in clause D.4B.2.4 for the PCell antenna connection if the PCell is on a band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using the antenna connection in clause D.4B.2.5 for the PCell antenna connection if the PCell is on a band where 4Rx is supported and 8Rx is not supported, or using the antenna connection in clause D.4B.2.6 for the PCell antenna connection if the PCell is on a band where 8Rx is supported.

All EN-DC tests are performed using the antenna connection in clause D.4B.2.1 for the PSCell or SCell antenna connection if an SCell or PSCell is on band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using antenna connection in clause D.4B.2.2 for the PSCell or SCell antenna connection if an SCell or PSCell is on a band where 4Rx is supported and 8Rx is not supported, or using antenna connection in D.4B.2.3 for the PSCell or SCell antenna connection if an SCell or PSCell is on a band where 8Rx is supported.

# D.4B.2 Antenna connection

## D.4B.2.1 Antenna connection for NR bands where 2Rx is supported

For bands where 2Rx is supported and either 4Rx or 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 2 of the 8 Rx ports are connected with data source from system simulator. The remaining 6 Rx ports shall be connected with zero input**.** No test parameters or requirements are modified.

### D.4B.2.2 Antenna connection for NR bands where 4Rx is supported

For bands where 4Rx is supported and 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 4 of the 8 Rx ports are connected with data source from system simulator. The remaining 4 Rx ports shall be connected with zero input. Except for the modifications to radio link monitoring thresholds and beam failure detection thresholds described in clause D.4A.2.1, no test parameters or requirements are modified.

### D.4B.2.3 Antenna connection for bands where 8Rx is supported

For bands where 8Rx is supported, all 8 Rx antennas are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clause D.4A.2.1, no test parameters or requirements are modified.

### D.4B.2.4 Antenna connection for E-UTRA bands where 2Rx is supported

For E-UTRAN bands where 2Rx is supported and 4Rx or 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 2 of the 8 Rx ports are connected with data source from system simulator. The remaining 6 Rx ports shall be connected with zero input. No test parameters or requirements are modified.

### D.4B.2.5 Antenna connection for E-UTRA bands where 4Rx is supported

For bands E-UTRAN where 4Rx is supported and 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 4 of the 8 Rx ports are connected with data source from system simulator. The remaining 4 Rx ports shall be connected with zero input. Except for the modifications to radio link monitoring thresholds described in TS 36.133 [23] clause A.3.8.1.2.1 and A.3.8.1.2.2, no test parameters or requirements are modified.

### D.4B.2.6 Antenna connection for E-UTRA bands where 8Rx is supported

For bands E-UTRAN where 8Rx is supported, all 8 Rx antennas are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in TS 36.133 [23] clause A.3.8.1.2.1 and A.3.8.1.2.2, no test parameters or requirements are modified.

## D.5 Test Cases with Different Channel Bandwidths

### D.5.1 Test Cases with Different E-UTRA Channel Bandwidths

#### D.5.1.1 Introduction

Test cases involving E-UTRA cell(s) may be defined with different E-UTRA channel bandwidths to verify the same type of RRM requirement.

#### D.5.1.2 Principle of testing

If multiple test cases involving E-UTRA cell(s) are defined with different E-UTRA channel bandwidths to verify the same type of RRM requirement that is E-UTRA channel bandwidth independent, then the UE needs to be tested with only one channel bandwidth in each E-UTRA cell and with the same bandwidth in all the E-UTRA cells used in the test case.

# D.6 Test Cases for Synchronous and Asynchronous DC Operations

## D.6.1 EN-DC Test Cases for Synchronous and Asynchronous EN-DC Operations

### D.6.1.1 Introduction

This clause defines a principle, which is applicable to test cases verifying RRM requirements for EN-DC operation in synchronous and asynchronous scenarios.

Test cases may be defined in both synchronous EN-DC and asynchronous EN-DC scenarios to verify the same type of RRM requirement.

### D.6.1.2 Principle of Testing

If EN-DC test cases are defined in both synchronous and asynchronous EN-DC scenarios to verify the same type of RRM requirement then the UE capable of both synchronous and asynchronous EN-DC operations needs to be tested with one of the tests in either synchronous or asynchronous EN-DC scenarios.

# D.7 CCA model

## D.7.1 Introduction

The CCA model is used in some RRM test cases with at least one cell on a carrier frequency with CCA. The intention with the CCA model is to emulate in the test equipment the behaviour of a gNB or UE which performs channel measurement to check that the channel is clear prior to performing one or more downlink or uplink transmissions.

## D.7.2 CCA model for operation on a carrier frequency with CCA in FR1

### D.7.2.1 DL CCA model

The same DL CCA model is applicable regardless of whether DRX cycle is used or not with the following differences:

- The counter, $l_{CCA,}$ is used to monitor the number of unavailable DBT samples withing an evaluation window, $W_{CCA_DL.}$ DBT samples outside of the evaluation window $W_{CCA_DL}$ are discarded.
- If DRX cycle is not used then prior to each DBT window, the test equipment shall determine whether the DL CCA attempt is successful (i.e., the corresponding signals have to be transmitted), based on probability $P_{CCA_DL}$ of successful DL CCA configured in the corresponding test case. If DRX cycle is not used, then the DL CCA model shall increment the counter $l_{CCA}$ for every unavailable DBT sample due to DL CCA failure.
- If DRX cycle is used, then the DL CCA model shall increment the counter, $l_{CCA}$, once per DRX cycle for a DRX cycle if the first DBT sample in that DRX cycle is unavailable due to DL CCA failure. DL CCA failures in a DRX cycle are determined as follows:
- The test system *in the first DBT window of each DRX cycle* determines whether the DL CCA attempt is successful or not using the principle as follows:
  - If the DL CCA is successful then the test system shall transmit in all DBT windows within that DRX cycle.
  - If the DL CCA is not successful then the test system shall not transmit in any of the DBT windows within that DRX cycle. In this case $l_{CCA}$ is increased by 1.
- The parameters, $L_{CCA_DL}$, $L_{CCA_UL}$, $W_{CCA_DL}$ and $W_{CCA_UL}$ can be used as in non-DRX tests.

If the CCA attempt is successful for a transmission, then the test equipment shall transmit also other remaining transmissions, according to the configuration, within the same DBT window.

If the CCA attempt is not successful for a transmission within the DBT window, the test equipment shall determine whether the CCA attempt is successful for the next configured transmission, based on probability $P_{CCA_DL}$.

The probability can be different in different time intervals $T_i$ during a test case. One probability value (per cell) applies at any time point during a test; one or more probability values can be configured in the entire test, one value $P_{CCA_DL}$ per time interval $T_i$ where $i \geq 1$, and the multiple time intervals (when $i>1$) do not overlap (e.g., $P_{CCA_DL}=1.0$ in $T_1$ and $P_{CCA_DL}=0.75$ in $T_2$).

For semi-static channel access configuration, a single value $P_{CCA_DL}$ is used to configure the probability of CCA success in different time intervals $T_i$ during a test realization. An additional limit $L_{CCA_DL}$ is used to determine the maximum number of unavailable DBT samples within an evaluation window $W_{CCA_DL}$. If the number of unavailable DBT samples on the last $W_{CCA_DL}$ DBT samples is larger or equal to $L_{CCA_DL}$, the CCA attempt is considered successful for transmission.

For dynamic channel access configuration, the parameters $P_{CCA_DL_1}$ and $P_{CCA_DL_2}$ are used to configure the probability of CCA success on the first and second SSB candidate positions, respectively, in different time intervals $T_i$ during a test realization. An additional limit $L_{CCA_DL}$ is used to determine the maximum number of unavailable DBT samples within an evaluation window $W_{CCA_DL}$. If the number of unavailable DBT samples on the last $W_{CCA_DL}$ DBT samples is larger or equal to $L_{CCA_DL}$, the CCA attempt is considered successful for transmission.

For semi-static channel access configuration or for dynamic channel access configuration where one candidate SSB position is modelled, prior to each discovery burst transmission window within a time interval Ti of the test, the test equipment shall:

1 - Generate a uniform random variable *p1* from the range [0, 1] for the first candidate position.

2 - Transmit the discovery burst based on *p1* in the first candidate position. If $p1 \leq P_{CCA_DL}$, the discovery burst is transmitted at the first candidate SSB location; else if $l_{CCA}$ is larger than or equal to $L_{CCA_DL,}$ the discovery burst is transmitted at the first candidate SSB location, otherwise the discovery burst is muted. If DRX cycle is used, then the decision whether the discover burst is muted or not is repeated for the rest of the DRX cycle.

For dynamic channel access configuration where two candidate SSB positions are modelled, prior to each discovery burst transmission window within a time interval $T_i$ of the test, the test equipment shall:

1 - Generate a uniform random variable *p1* from the range [0, 1] for the first candidate position.

2 - Transmit the discovery burst based on *p1* in the first candidate position: if $p1 \leq P_{CCA_DL1}$, the discovery burst is transmitted at first candidate SSB location, else the test equipment shall:

a - Generate a uniform random variable *p2* from the range [0, 1] for the second candidate SSB position.

b - Transmit the discovery burst based on *p2* in the second candidate position. If $p2 \leq P_{CCA_DL2}$, the discovery burst is transmitted at the second candidate SSB location; else if $l_{CCA}$ is larger than or equal to $L_{CCA_DL}$, the discovery burst is transmitted at the second candidate SSB location, otherwise the discovery burst is muted. If DRX cycle is used, then the decision whether the discover burst is muted or not is repeated for the rest of the DRX cycle.

The above steps are repeated for each discovery burst transmission window in each time interval $T_i$ of the test. The limit $L_{CCA_DL}$ and window $W_{CCA_DL}$ is a configuration parameter for each test case.

In many test cases, the requirement under a test depends on the number of configured SSB transmissions which are not available during the test due to CCA failure, so the test equipment shall track how many such signal occasions are not transmitted in DL during the test period.

## D.7.2.2 UL CCA model

For UL CCA, the modelling approach is based on probability $P_{CCA_UL}$ of successful CCA. Probability $P_{CCA_UL}$ is configured in the corresponding test case, based on a set $S_{CCA_UL}$ of possible values including 75 % and 87% as typical values for dynamic and semi-static channel access configurations, 0% to model consistent UL CCA failures, and 100% to model no UL CCA failures.

Consistent UL CCA failures are modelled by configuring a low value for $P_{CCA_UL}$, e.g., $P_{CCA_UL}$ = 0%.

In the same time interval $T_i$ during the same test case, $P_{CCA_UL}$ can be different from $P_{CCA_DL}$.

The probability can be different in different time intervals $T_i$ during a test case. One probability value applies at any time point during a test; one or more probability values can be configured in the entire test, one value $P_{CCA_UL}$ per time interval $T_i$ where $I \geq 1$, and the multiple time intervals (when $I > 1$) do not overlap (e.g., $P_{CCA_UL} = 1.0$ in $T_1$ and $P_{CCA_UL} = 0.75$ in $T_2$).

$T_{CCA}$ µs prior to each UL transmission burst in the test, the test equipment (TE) shall generate a uniform random variable p from the range [0, 1]. If $p<P_{CCA_UL}$, the TE transmits an OCNG noise pattern with an energy level X per LBT measurement BW, within the UE BW scheduled/configured for the UL transmission for at-least $T_{CCA}$ µs. Where $T_{CCA}$ µs is energy detection time for accessing the uplink channel as defined in section 5.1.1 of TS 37.106 [36]. Where:

- X is $10.5^{Note1}$ dB above the energy detection threshold defined in section 5.1.1 of TS 37.106 [36].
- $T_{CCA}$ is the channel sensing period depending on CCA category for the next UL transmission.

The TE shall count the number of UL CCA failures, and no further UL CCA failures are modelled if the number of failures exceeds the limit $L_{CCA_UL}$ within a window $W_{CCA_UL}$. For each UL CCA failure generated by the model, the TE shall monitor the corresponding UL resource for the desired UL signal and based on when and/or whether the TE received the desired UL signal, it deems the test case to pass or fail.

In many cases, the requirement under a test depends on the number of configured signal occasions which are not available during the test, so the test equipment shall track how many such signal occasions are not transmitted in UL during the test period.

Note1: Includes measurement uncertainty for OCNG noise as defined in Table F.1.1.2-1.

## D.7.3 Void

# D.8 Test Cases in SA and EN-DC Operations

## D.8.0 General

This clause defines a principle which is applicable to test cases verifying RRM requirements in standalone (SA) or EN-DC operations. RRM test cases may be defined in SA and EN-DC operations to verify the same RRM requirement.

The normative reference for this section is TS 38.133 [6] clause A.3.13.

*Editor's note: this clause may need to define further for NE-DC and NR-DC test cases, which subjects to the test cases defined in the future.*

## D.8.1 Principle of testing

If test cases are defined in both SA and EN-DC operations to verify the same RRM requirement then the UE capable of both SA and EN-DC operations needs to verify that RRM requirement by performing test case(s) in either SA operation or in EN-DC operation.

If test cases are defined in both SA and EN-DC operations to verify at least one common RRM requirement then the UE capable of both SA and EN-DC operations needs to verify RRM requirements by performing test case(s) in either SA operation or in EN-DC operation provided that the performed test case(s):

- verifies the largest number of RRM requirements and
- verifies at least all RRM requirements covered in the test case(s), which is not performed.

# Annex E (normative): Cell configuration mapping

## E.0 General

The cells used in TS 38.533 do not correspond to the cells defined in TS 38.508-1 [14] clause 4.4.2. This annex describes the mapping between the test cases in TS 38.533 and the cells defined in TS 38.508-1 [14]. The test case shall apply the RF parameters as defined in TS 38.533 according to the column heading.

NOTE: For example if the second cell in a test case is an inter-frequency cell then Cell3 from TS 38.508-1 [14] clause 4.4.2 is used with the radio parameters as defined for Cell2 in TS 38.533.

## E.1 Test frequency selection

### E.1.0 General

The requirements defined in this test specification comprise EN-DC and NR/5GC test cases. The test cases are defined with a single NR cell or with multiple NR cells. The multi-cell test cases can be either intra-frequency, i.e. the NR cells defined by the test are overlapping in the frequency domain, or inter-frequency, i.e. the NR cells defined by the test have different centre frequencies, separated from each other by a frequency value bigger than the respective cell bandwidths. This clause describes the general rule on how to select the test frequencies for the NR RRM test cases in this test specification.

### E.1.1 E-UTRA PCell for EN-DC test cases

Unless otherwise stated, the E-UTRA PCell for EN-DC test cases shall be configured using the test frequency “Mid” as defined in TS 36.508 [25] for the corresponding E-UTRA band.

In case that the “Mid” test frequency overlaps with any of the NR test frequencies required by the test case, the E-UTRA PCell shall be shifted to an additional frequency within the E-UTRA same band. If the E-UTRA band channel bandwidth is not sufficient to allocate a non-overlapping E-UTRA PCell, the auxiliary band as defined in TS 36.521-3 [26] clause 3 shall be used.

### E.1.2 Test cases with one NR cell

Unless otherwise stated, for NR test cases with one NR cell, this cell shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding band under test.

### E.1.3 Test cases with more than one NR cell

#### E.1.3.1 Intra-frequency test cases

Unless otherwise stated, multi-cell intra-frequency test cases shall be tested using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding NR band under test.

#### E.1.3.2 Inter-frequency test cases

For NR/5GC and EN-DC multi-cell inter-frequency test cases in FR1, unless otherwise stated, the serving cell shall be configured using the test frequency “Low” as defined in TS 38.508-1 [14] for the corresponding band under test. Any inter-frequency neighbour cell shall be configured using the test frequency “High” as defined in TS 38.508-1 [14] for the corresponding band under test. For the 2nd inter-frequency neighbour cell shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding band under test.

For NR/5GC multi-cell inter-frequency test cases in FR2, unless otherwise stated, the serving cell (and any other neighbour cell in the same frequency carrier) shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14], clause 7.2.3.2 for the corresponding band under test. Any inter-frequency neighbour cell shall be configured using a non-overlapping test frequency adjacent to the serving cell frequency, as defined in TS 38.508-1 [14], clause 7.2.3.2.

For EN-DC multi-cell inter-frequency test cases in FR2, unless otherwise stated, the PSCell (and any other neighbour cell in the same frequency carrier) shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] , clause 7.2.3.2 for the corresponding band under test. Any inter-frequency neighbour cell shall be configured using a non-overlapping test frequency adjacent to the PSCell frequency, as defined in TS 38.508-1 [14] , clause 7.2.3.2.

# E.1.4 Carrier aggregation test cases

## E.1.4.1 Inter-band carrier aggregation

For inter-band carrier aggregation test cases, each of the component carriers and their respective neighbour cells shall be configured following the same principles defined in E.1.2 and E.1.3.

## E.1.4.2 Intra-band contiguous carrier aggregation

For intra-band contiguous carrier aggregation with 2 CCs in FR1, unless otherwise specified, the serving cells (and any other neighbour cell(s) in the same frequency carriers) shall be configured using the test frequency “Low” as defined in TS 38.508-1 [14], subclause 4.3.1.1.3 for the corresponding band under test (SpCC = CC1 and SCC = CC2).

For intra-band contiguous carrier aggregation with 2 CCs in FR2, unless otherwise specified, the serving cells (and any other neighbour cell(s) in the same frequency carriers) shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14], subclause 4.3.1.2.3 for the corresponding band under test (SpCC = CC1 and SCC = CC2).

## E.1.4.3 Intra-band non-contiguous carrier aggregation

For intra-band non-contiguous carrier aggregation in FR1, unless otherwise specified, the test frequency selection shall be done following the maximum Wgap principle, i.e. selecting the test frequencies (of the test frequencies defined in TS 38.508-1 [14]) with the widest frequency separation within the band under test.

For intra-band non-contiguous carrier aggregation in FR2, the test frequency selection is TBD.

# E.1.5 E-UTRA – NR inter RAT test cases

Unless otherwise stated, the E-UTRA serving/neighbour cell for E-UTRA – NR inter-RAT test cases shall be configured using the test frequency “Mid” as defined in TS 36.508 [25] for the corresponding E-UTRA band.

In case that the “Mid” test frequency overlaps with any of the NR test frequencies required by the test case, the E-UTRA cell shall be shifted to an additional frequency within the E-UTRA same band. If the E-UTRA band channel bandwidth is not sufficient to allocate a non-overlapping E-UTRA cell, the auxiliary band as defined in TS 36.521-3 [26] clause 3 shall be used.

# E.1.6 Intra-band EN-DC test cases

## E.1.6.1 Intra-band non-contiguous EN-DC

For intra-band non-contiguous EN-DC in FR1, unless otherwise specified, the test frequency selection shall be done following the maximum Wgap principle, i.e. selecting the test frequencies (of the test frequencies defined in TS 38.508-1 [14]) with the widest frequency separation within the band under test.

### E.1.6.1.1 Inter-frequency neighbour cell

Unless otherwise stated, any inter-frequency neighbour cell shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding NR band under test. If the NR band channel bandwidth is not sufficient to allocate a non-overlapping the neighbour cell, the auxiliary band as defined in TBD shall be used.

## E.1.6.2 Intra-band contiguous EN-DC

### E.1.6.1.1 E-UTRA PCell

Unless otherwise stated, the E-UTRA PCell for intra-band contiguous EN-DC test cases shall be configured using same test frequency, e.g., “Mid” as for NR PSCell as defined in TS 38.508-1 [14].

### E.1.7 NR sidelink test cases

Unless otherwise stated, for NR sidelink test cases the NR sidelink carrier shall be configured using the test frequency "Mid" as defined in TS 38.508-1 [14] for the corresponding band under test.

For con-current operation, unless otherwise stated, each of the NR Uu carriers and their respective cells shall be configured following the sample principles defined in E.1.2 and E.1.3.

## E.2 Cell configuration mapping for EN-DC FR1 test cases in Chapter 4

Table E.2-1 defines the cell configuration mapping for EN-DC FR1 test cases in chapter 4 of this test specification.

# Annex F (normative): Measurement uncertainties and test tolerances

The requirements of this clause apply to all tests in the present document.

## F.1 Measurement uncertainties and test tolerances for FR1 and FR2

### F.1.1 Acceptable uncertainty of test system (normative)

See TS 38.521-1 [17] annex F.1.

#### F.1.1.1 Measurement of test environments

See TS 38.521-1 [17] Annex F1.1.

#### F.1.1.2 Measurement of RRM requirements

This clause defines the maximum test system uncertainty for the RRM requirements. The maximum uncertainty values allowed for the typical RRM measurement uncertainty contributors is defined in Table F.1.1.2-1 and Table F.1.1.2-2. Unless explicitly stated for a particular test case, these maximum uncertainty values should be used as starting point to perform the test tolerance analysis in TR 38.903 [22] for each of the test cases. Specific test cases might require a tighter measurement uncertainty value for some of the contributors. Exceptions to the general values in Table F.1.1.2-1 and Table F.1.1.2-2 shall be handled case by case.

**Table F.1.1.2-1: Maximum allowed measurement uncertainty values for the test system for FR1 (up to 6 GHz) and Cell BW ≤ 40 MHz**

## F.1.2 Interpretation of measurement results (normative)

See TS 38.521-1 [17] Annex F.2.

## F.1.3 Test Tolerance and Derivation of Test Requirements (informative)

See TS 38.521-1 [17] Annex F.3.

### F.1.3.1 Measurement of test environments

See TS 38.521-1 [17] Annex F.3.1.

### F.1.3.2 Measurement of RRM requirements

Because the relationships between the test system uncertainties and the test tolerances are often complex, it is not always possible to give a simple derivation of the test requirement in this document. The analysis is recorded in 3GPP TR 38 903 [22].

The derivation of the test requirements for the EN-DC FR1 test cases in chapter 4 is defined in Table F.1.3.2-1.

The derivation of the test requirements for the NE-DC FR1 test cases in chapter 4 is defined in Table F.1.3.2-1a.

The derivation of the test requirements for the NR/5GC FR1 test cases in chapter 6 is defined in Table F.1.3.2-2.

The derivation of the test requirements for the EN-DC FR2 test cases in chapter 5 is defined in Table F.1.3.2-3.

The derivation of the test requirements for the NR/5GC FR2 test cases in chapter 7 is defined in Table F.1.3.2-4.

The derivation of the test requirements for the E-UTRA – NR inter-RAT with E-UTRA serving cell test cases in chapter 8 is defined in Table F.1.3.2-5.

The derivation of the test requirements for the FR1 NR sidelink test cases in chapter 9 is defined in Table F.1.3.2-6.

The derivation of the test requirements for the EN-DC FR1 test cases for shared spectrum in chapter 10 is defined in Table F.1.3.2-10.

The derivation of the test requirements for the NR/5GC FR1 test cases for shared spectrum in chapter 11 is defined in Table F.1.3.2-11.

The derivation of the test requirements for the E-UTRA – NR inter-RAT with E-UTRA serving cell test cases for shared spectrum in chapter 12 is defined in Table F.1.3.2-12.

The derivation of the test requirements for the NR/5GC FR1 test cases with SCell in shared spectrum in chapter 13 is defined in Table F.1.3.2-13.

The derivation of the test requirements for SA FR1 Satellite access test cases in chapter 14 is defined in Table F.1.3.2-14.

The derivation of the test requirements for the NR/5GC FR1 test cases for RedCap in chapter 16 is defined in Table F.1.3.2-7.

The derivation of the test requirements for the NR/5GC FR2 test cases for RedCap in chapter 17 is defined in Table F.1.3.2-8.

The derivation of the test requirements for the E-UTRA – NR inter-RAT with E-UTRA serving cell test cases for RedCap in chapter 18 is defined in Table F.1.3.2-9.

The derivation of the test requirements for the NR/5GC FR1 test cases for ATG in chapter 19 is defined in Table F.1.3.2-15.

# Annex G (normative): Statistical testing

## G.1 General

The test requirements are expressed as absolute requirements with a single value stating the requirement or expressed as a success rate. The statistical nature depends on the type of test requirement. Some have large statistical variations, while others are not statistical in nature at all. When testing a parameter with a statistical nature, a confidence level is set. This establishes the probability that a Device Under Test (DUT) passing the test actually meets the test requirement and determines how many times a test have to be repeated and what the pass and fail criteria is. This Annex describes how to set the statistical significance.

## G.2 Statistical testing of delay and UE measurement performance in RRM tests

### G.2.1 General

The RRM tests are either of deterministic or of statistical nature. The pass fail limits in tests of statistical nature are expressed as a limit (e.g. delay limit) and a success ratio applicable for the limit. The success ratio is 90% uniform (the complement is the error ratio ER = 10%).

### G.2.2 Design of the test

The test is defined by the following design principles (see TS 36.521-1 clause G.X, Theory):

1) The early decision concept is applied.

2) A second limit is introduced: bad DUT factor M>1

To decide the test pass:

Supplier risk is applied based on the bad DUT quality

To decide the test fails

Customer risk is applied based on the specified DUT quality

The test is defined by the following parameters:

1) Limit ER = 0.1 (success ratio = 90%)

2) Bad DUT factor M=1.5 (selectivity)

3) Confidence level CL = 95% (for specified DUT and bad DUT-quality)

### G.2.3 Numerical definition of the pass fail limits

Editor's Note:

- Further investigate the technical details behind this statistical method to ensure that this is applicable for FR2 radiated test cases.

## G.2.4 Pass fail decision rules

The pass fail decision rules apply for a single test, comprising one component in the test vector. The over all Pass /Fail conditions are defined in clause G.2.6

Having observed 0 errors, pass the test at 33+ samples, otherwise continue

Having observed 1 error, pass the test at 46+ samples, otherwise continue

Having observed 2 errors, pass the test at 58+ samples, otherwise continue

Having observed 10 errors, pass the test at 136+ samples, fail the test at 39 samples, otherwise continue

Having observed 146 errors, pass the test at 1181+ samples, fail the test at 1173- samples, otherwise continue

Having observed 147 errors, fail the test at 1182- samples,

Where x+ means: x or more, x- means x or less

NOTE 1: an ideal DUT passes after 33 samples. The maximum test time is 1181 samples.

## G.2.7 Additional considerations for tests in bands subject to CCA failure

The scope of shared spectrum RRM tests is similar to their corresponding licensed carrier tests. However, the unlicensed channel accessibility is subject to a probabilistic Clear Channel Assessment (CCA) model and therefore is not guaranteed. This model applies independently to DL ($P_{CCA_DL_i}$) and UL ($P_{CCA_UL}$) and is defined in section D.7.

The SS has knowledge on whether a given DL or UL slot is subject to CCA failure:

- In DL slots subject to CCA failure the SS will not schedule the slot
- In UL slots subject to CCA failure the SS will occupy the channel according to section D.7.2.2

Due to the statistical nature of the CCA model, iterations can fail. In the event the SS detects a failure caused by CCA failure, the SS shall declare that iteration as inconclusive (remove it from the count) and continue testing.

Table G.2.7-1 lists test cases from sections 10, 11, 12 and 13 that have been considered as untestable due to issues related with how the CCA model impacts the test outcome. Unless otherwise listed in Table G.2.7-1, all tests from sections 10, 11, 12 and 13 can be executed following the statistical methodology defined in clause G.2.3.

# G.3 Statistical testing of NR sidelink CBR measurement tests

## G.3.1 General

The CBR measurement tests are of statistical nature. The pass fail limits in tests of statistical nature are expressed as a limit (e.g. delay limit) and a success ratio applicable for the limit. The success ratio is 98% (the complement is the error ratio ER = 2%).

## G.3.2 Design of the test

The test is defined by the following design principles (see TS 36.521-1 clause G.7, Theory):

1) The early decision concept is applied.

2) A second limit is introduced: bad DUT factor M>1

To decide the test pass:

- Supplier risk is applied based on the bad DUT quality

To decide the test fails

- Customer risk is applied based on the specified DUT quality

The test is defined by the following parameters:

1) Limit ER = 0.02 (success ratio = 98%)

2) Bad DUT factor M=1.5 (selectivity)

3) Confidence level CL = 95% (for specified DUT and bad DUT-quality)

## G.3.4 Pass fail decision rules

The pass/fail decision rules apply for a single test, comprising one component in the test vector. The over all pass/fail conditions are defined in clause G.2.6:

Having observed 0 error, pass the test at 206+ samples, otherwise continue,

Having observed 1 error, pass the test at 287+ samples, otherwise continue,

Having observed 2 errors, pass the test at 345+ samples, otherwise continue,

Having observed 3 errors, pass the test at 398+ samples, fail the test at 10- samples, otherwise continue,

…

Having observed 143 errors, pass the test at 6427+ samples, fail the test at 6124- samples, otherwise continue,

Having observed 144 errors, fail the test at 6427- samples,

Where x+ means: x or more, x- means x or less.

NOTE 1: an ideal DUT passes after 206 samples. The maximum test time is 6427 samples.

## G.5.1 Algorithm to calculate pass and fail probabilities

Following basic assumptions for statistical testing are introduced in this clause:

- Result of single iteration of test procedure loop obeys Bernoulli distribution with error ratio $p$, i.e. the probability that the TE observes expected UE behaviour in single iteration (counted as a success) is $1 - p$ and the probability that the TE doesn't observe expected UE behaviour in single iteration (counted as a fail) is $p$.
- Results of different iterations are independent and identically distributed (i.i.d).
- Early decision concept is applied, i.e., the TE repeats multiple iterations of the test procedure loop. For each iteration the TE records its result (count as a success if the TE observes the expected behavior, count as a fail otherwise) and its index in all iterations. When the i-th fail is observed in $e_i$-th iteration, the TE compares $e_i$ with corresponding pass limit $N_{p,i}$ and fail limit $N_{f,i}$. The TE shall:
  - terminate the test and decide the DUT passes the test if $e_i > N_{p,i}$
  - terminate the test and decide the DUT fails the test if $e_i \leq N_{f,i}$,
  - continue the test and make no decision if $N_{f,i} < e_i \leq N_{p,i}$.

For a more intuitive understanding, we use the state transition diagram shown in Figure G.5.1-1 to describe the entire process of statistical testing. In Figure 1, X-axis and Y-axis denote the success count and fail count in iterations already executed respectively. And the point with coordinate $(i, j)$ (referred as *state* $(i, j)$ thereafter) is used to indicates that the DUT has executed $i + j$ iterations which includes $i$ successes and $j$ fails, where $i, j \geq 0$.

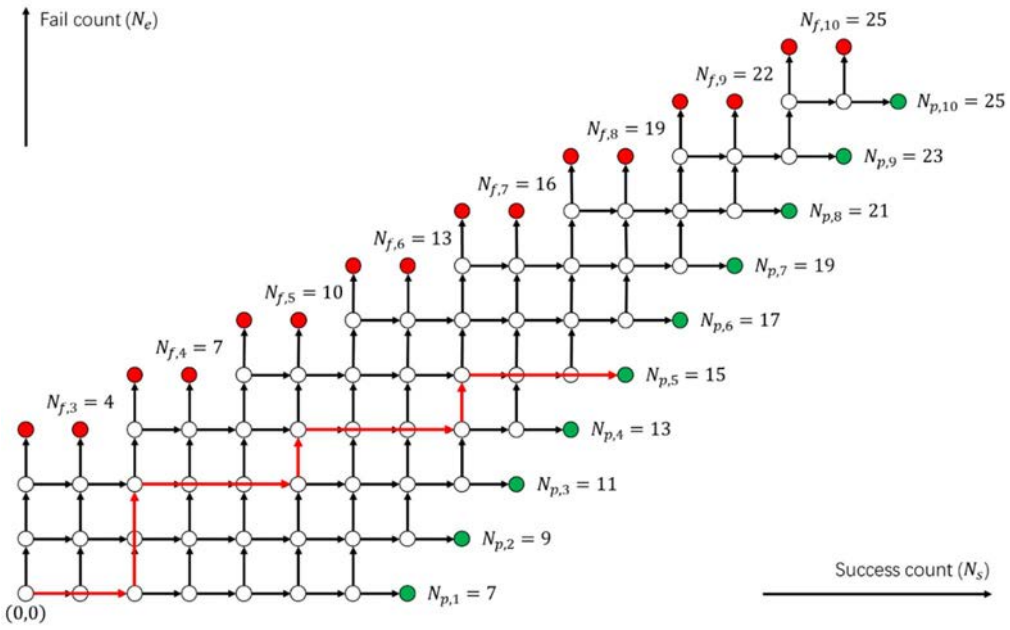

**Figure G.5.1-1: Visualization of early decision statistical testing process. In this example, the TE verdicts that the DUT passes the test after executing 15 iterations of test procedure loop. The results of these 15 iterations are "s", "f", "f", "s", "s", "s", "f", "s", "s", "s", "f", "s", "s" and "s" in order ("s" = "success" and "f" = "fail")**

From Figure G.5.1-1 it's straightforward to get following observations:

- The DUT is always in state $(0,0)$ at the beginning of statistical test since no iteration is executed at that moment.
- Assume the DUT is in state $(i,j)$ after executing $i+j$ iterations. Then,
  - if the $i+j+1$-th iteration counts a success (with probability $1-p$), the success count shall increase 1 and fail count shall remain unchanged after the $i+j+1$-th iteration. As a result, the DUT will be in state $(i+1,j)$ after the $i+j+1$-th iteration. We call that the DUT moves from state $(i,j)$ to state $(i+1,j)$, depicted as moving right by one in the diagram.
  - if the $i+j+1$-th iteration counts a fail (with probability $p$), the success count remains unchanged and the fail count increases 1 after the $i+j+1$-th iteration. Then the DUT will be in state $(i,j+1)$ after the $i+j+1$-th iteration. We call that the DUT moves from state $(i,j)$ to state $(i,j+1)$, depicted as moving up by one in the diagram.
- The TE shall evaluate whether pass criteria or fail criteria is satisfied every time the DUT has executed a new iteration, i.e. the DUT moves to a new state. Specifically speaking,
  - If pass criterion is satisfied when DUT is in state $(i,j)$, the TE makes the decision that the DUT passes the test. Correspondingly, state $(i,j)$ is referred as a passing state (depicted as green points in Figure G.5.1-1);
  - If fail criterion is satisfied when DUT is in state $(i,j)$, the TE makes the decision that the DUT fails the test. Correspondingly, state $(i,j)$ is referred as a failure state (depicted as red points in Figure G.5.1-1).
  - If neither pass criterion nor fail criterion is satisfied when DUT is in state $(i,j)$, the TE makes no decision and continues the test. Correspondingly, state $(i,j)$ is referred as a non-decidable state (depicted as hollow points in Figure G.5.1-1).

In this way, the statistical testing is represented as a process in which the DUT starts from state $(0,0)$, moves along certain path in the diagram, and finally stops in certain passing state or failure state.

Obviously, there must be a close relationship between the pass/fail states and the pass/fail limits used for the test. The following two conclusions precisely describes the mapping between pass/fail limits and pass/fail states.

**Conclusion 1:** The DUT is decided to pass the test if and only if the DUT moves from state $(0,0)$ to a state belongs to passing state set $\mathcal{P} = \{(N_{p,i+1} - i, i): i = 0,1,2, \cdots\}$.

**Proof**: We prove sufficiency first, and then necessity.

- **Sufficiency**: If the DUT is in state $(N_{p,i+1} - i, i)$, it means that the DUT has executed $N_{p,i+1}$ iterations which includes $i$ success and $N_{p,i+1} - i$ fails. Clearly, the TE can only get the i+1-th fail as early as the $N_{p,i+1} + 1$-th iteration, then we have $e_{i+1} > N_{p,i+1}$. This is just the pass criterion when the TE collecting the i+1-th fail.

- **Necessity**: If the TE verdicts the DUT to pass when it collects the i+1-th fail, following inequations must have been satisfied according to the pass criterion:

$$e_1 \le N_{p,1}, e_2 \le N_{p,2}, \cdots, e_i \le N_{p,i}, e_{i+1} > N_{p,i+1}.$$

  The DUT is in state $(e_i - i, i)$ when the i-th fail happens in the $e_i$-th iteration. Then the next $N_{p,i+1} - e_i$ iterations after the $e_i$-th iteration must be counted as success since $e_{i+1} > N_{p,i+1}$. Then the DUT will be in state $(N_{p,i+1} - i, i)$ after executing these $N_{p,i+1} - e_i$ iterations.

**Conclusion 2**: The DUT is decided to fail the test if and only if the DUT moves from state $(0,0)$ to a state belongs to failure set $\mathcal{F} = \{(j, i+1): N_{f,i} - i < j \le N_{f,i+1} - (i+1), i = 0,1,2, \cdots\}$, where $N_{f,0} \triangleq -1$ for sake of simplify.

Proof of conclusion 2 is quite similar as the proof of conclusion 1 and is omitted here. Conclusion 1 and 2 have shown the equivalence between pass/fail limits and pass/fail state sets. As a result, the probability that the DUT pass the test for given error ratio $p$, passing state set $\mathcal{P}$ and failure state set $\mathcal{F}$, denoted as $\mathbb{P}_p(\mathcal{P}, \mathcal{F})$, is given by

$$\mathbb{P}_p(\mathcal{P}, \mathcal{F}) = \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to state } (i,j) \text{ which belongs to } \mathcal{P}\}.$$

Furthermore, it's easy to prove that any path from state$(0,0)$ to passing state $(i,j)$ won't pass through any passing state or failure state except the ending state. This is because if the path contains a passing state or failure state $(i', j')$ which is not the ending state, the test will be terminated immediately when the DUT is in state $(i', j')$. Then $(i', j')$ shall be the ending state, i.e. $(i', j') = (i, j)$. This contradicts the assumption that state $(i', j')$ is not the ending state. This also means that two events "DUT moves from state $(0,0)$ to passing state $(i,j)$" and "DUT moves from state $(0,0)$ to passing state $(i', j')$" are disjoint if $(i', j') \neq (i, j)$. Then we have,

$$\mathbb{P}_p(\mathcal{P}, \mathcal{F}) = \sum_{(i,j)\in\mathcal{P}} \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to passing state } (i,j)\} = \sum_{(i,j)\in\mathcal{P}} T^p_{(i,j)}(\mathcal{P}, \mathcal{F}),$$

where $T^p_{(i,j)}(\mathcal{P}, \mathcal{F})$ is defined as the transition probability from state $(0,0)$ to state $(i,j)$, i.e.

$$T^p_{(i,j)}(\mathcal{P}, \mathcal{F}) \triangleq \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to state } (i,j)\}.$$

Similarly, the probability that the DUT fail the test for given error ratio $p$, passing state set $\mathcal{P}$ and failure state set $\mathcal{F}$, denoted as $\mathbb{F}_p(\mathcal{P}, \mathcal{F})$, is derived as

$$\mathbb{F}_p(\mathcal{P}, \mathcal{F}) = \sum_{(i,j)\in\mathcal{F}} T^p_{(i,j)}(\mathcal{P}, \mathcal{F})$$

From the discussion above we can observe that the calculation of the $\mathbb{P}_p(\mathcal{P}, \mathcal{F})$ and $\mathbb{F}_p(\mathcal{P}, \mathcal{F})$ is finally transformed into the calculation of the transition probability $T^p_{(i,j)}(\mathcal{P}, \mathcal{F})$. Assuming DUT is in state $(i,j)$ after the $i+j$-th iteration, $i, j \ge 0$. Considering that the $i+j$-th iteration can only have two possible results: success or fail, we can derive that the DUT can only be in state $(i-1, j)$ or state $(i, j-1)$ after executing $i+j-1$ iterations. Then we have:

$$\begin{aligned} T^p_{(i,j)}(\mathcal{P}, \mathcal{F}) = {} & \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to state } (i,j), \text{passing } (i-1,j)\} \\ & + \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to state } (i,j), \text{passing state } (i,j-1)\} \\ & = \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to } (i-1,j)\}\text{Prob}\{\text{DUT moves from state } (i-1,j) \text{ to } (i,j)\} \\ & + \text{Prob}\{\text{DUT moves from state}(0,0) \text{ to } (i,j-1)\}\text{Prob}\{\text{DUT moves from state } (i,j-1) \text{ to } (i,j)\} \end{aligned}$$

The first equation above holds because the event "DUT moves from state $(0,0)$ to state $(i,j)$, passing state $(i,j-1)$" and event "DUT moves from state $(0,0)$ to state $(i,j)$, passing state $(i-1,j)$" are disjoint. And the second equation above holds because results of different iterations are independent.

Furthermore, we have following obvious observations:

If $i = 0$, obviously the event "DUT moves from state $(0,0)$ to state $(i-1, j)$" won't happen since state $(i-1, j)$ doesn't exist in this case. Otherwise, the probability that this event occurs equals to $T^{p}_{(i-1,j)}(\mathcal{P}, \mathcal{F})$ according to the definition of transition probability. Then we have

$$\text{Prob}\{\text{DUT moves from state}(0,0) \text{ to } (i-1, j)\} = T^{p}_{(i-1,j)}(\mathcal{P}, \mathcal{F})\mathbb{I}_{i>0},$$

Similarly, we can also derive that

$$\text{Prob}\{\text{DUT moves from state}(0,0) \text{ to } (i, j-1)\} = T^{p}_{(i,j-1)}(\mathcal{P}, \mathcal{F})\mathbb{I}_{j>0},$$

Where, $\mathbb{I}_{i>0}$ and $\mathbb{I}_{j>0}$ are indicator functions,

$$\mathbb{I}_{i>0} = \begin{cases} 1, & \text{if } i > 0 \\ 0, & \text{otherwise} \end{cases}, \qquad \mathbb{I}_{j>0} = \begin{cases} 1, & \text{if } j > 0 \\ 0, & \text{otherwise} \end{cases}$$

If $(i-1, j) \in \mathcal{P} \cup \mathcal{F}$, the event "DUT moves from state $(i-1, j)$ to state $(i, j)$" won't happen since the test will be terminated when DUT reaches state $(i-1, j)$. Otherwise, this event is equivalent to the event "result of the $(i+j)$-th iteration is a success". Then we have

$$\text{Prob}\{\text{DUT moves from state } (i-1, j) \text{ to } (i, j)\} = (1-p)\mathbb{I}_{(i-1,j)\notin \mathcal{P}\cup\mathcal{F}}$$

Similarly, we can also derive that

$$\text{Prob}\{\text{DUT moves from state } (i, j-1) \text{ to } (i, j)\} = p\mathbb{I}_{(i,j-1)\notin \mathcal{P}\cup\mathcal{F}}.$$

where,

$$\mathbb{I}_{(i-1,j)\notin \mathcal{P}\cup\mathcal{F}} = \begin{cases} 1, & (i-1, j) \notin \mathcal{P} \cup \mathcal{F} \\ 0, & \text{otherwise} \end{cases}, \qquad \mathbb{I}_{(i,j-1)\notin \mathcal{P}\cup\mathcal{F}} = \begin{cases} 1, & \text{if } (i, j-1) \notin \mathcal{P} \cup \mathcal{F} \\ 0, & \text{otherwise} \end{cases}$$

Finally, we have shown that following conclusion holds.

**Conclusion 3**: Transition probability $T^{p}_{(i,j)}(\mathcal{P}, \mathcal{F})$ can be calculated by

$$T^{p}_{(i,j)}(\mathcal{P}, \mathcal{F}) = T^{p}_{(i-1,j)}(\mathcal{P}, \mathcal{F})(1-p)\mathbb{I}_{i>0}\mathbb{I}_{(i-1,j)\notin \mathcal{P}\cup\mathcal{F}} + T^{p}_{(i,j-1)}(\mathcal{P}, \mathcal{F})p\mathbb{I}_{j>0}\mathbb{I}_{(i,j-1)\notin \mathcal{P}\cup\mathcal{F}}.$$

The conclusion above shows that $T^{p}_{(i,j)}(\mathcal{P}, \mathcal{F})$ can be calculated in a dynamic programming manner: Clearly, we can calculate $T^{p}_{(i,j)}(\mathcal{P}, \mathcal{F})$ using the above equation if we know the value of $T^{p}_{(i-1,j)}(\mathcal{P}, \mathcal{F})$ and $T^{p}_{(i,j-1)}(\mathcal{P}, \mathcal{F})$; For the same reason, we can calculate $T^{p}_{(i-1,j)}(\mathcal{P}, \mathcal{F})$ and $T^{p}_{(i,j-1)}(\mathcal{P}, \mathcal{F})$ using the equation above if we know the value of $T^{p}_{(i-2,j)}(\mathcal{P}, \mathcal{F})$, $T^{p}_{(i-1,j-1)}(\mathcal{P}, \mathcal{F})$ and $T^{p}_{(i,j-2)}(\mathcal{P}, \mathcal{F})$; Repeating the recursion above, at last all we need to know is only $T^{p}_{(0,0)}(\mathcal{P}, \mathcal{F})$. And we know $T^{p}_{(0,0)}(\mathcal{P}, \mathcal{F}) = 1$ since UE always is in state $(0,0)$ when test starts.

Using the recursion above, we can finally obtain $T^{p}_{(i,j)}(\mathcal{P}, \mathcal{F})$ and further $\mathbb{P}_p(\mathcal{P}, \mathcal{F})$ and $\mathbb{F}_p(\mathcal{P}, \mathcal{F})$ for given $p$, $\mathcal{P}$ and $\mathcal{F}$.

Assume the limit-risk mapping given in 36.521-1 is still used. Then the customer risk $R_c$ and supplier risk $R_s$ for given passing state set $\mathcal{P}$ and failure state set $\mathcal{F}$ is the probability that baseline bad DUT (error ratio = $Mp$, where $M$ is the bad DUT factor) passes the test and the probability that baseline good DUT (error ratio = $mp$, where $m$ is the bad DUT factor) fails the test respectively. Then we have

$$R_c = \sum_{(i,j)\in\mathcal{P}} T^{Mp}_{(i,j)}(\mathcal{P}, \mathcal{F}), \quad R_s = \sum_{(i,j)\in\mathcal{F}} T^{mp}_{(i,j)}(\mathcal{P}, \mathcal{F}).$$

## G.5.2 Method of designing pass/fail limit to approach given risk probability

For given error ratio $p$, confidence level $P_{CL}$, good DUT factor $m$ and bad DUT factor $M$, pass limit $\{N_{p,i}, i = 1,2,\cdots\}$ and fail limit $\{N_{f,i}: i = 1,2,\cdots\}$ can be obtained by using the method listed below. Note that the limit-risk mapping in 36.521-1 is assumed.

**Step 1**: Initialize as follows:

- Set $\mathcal{P}$ and $\mathcal{F}$, passing state set and failure state set respectively, as $\mathcal{P}, \mathcal{F} = \emptyset$.
- Set $R_c$ and $R_s$, customer risk and supplier risk respectively, as $R_c, R_s = 0$;
- Set $n$, number of executed iterations, as $n = 0$;
- Set $\mathcal{S}$, non-decidable state set after $n$-th iteration, as $\mathcal{S} = \{(0,0)\}$;
- Set $T^{mp}_{(i,j)}(\mathcal{P}, \mathcal{F})$ and $T^{Mp}_{(0,0)}(\mathcal{P}, \mathcal{F})$, transition probability to state $(0,0)$ for baseline good DUT and for baseline bad DUT respectively, as $T^{mp}_{(i,j)}(\mathcal{P}, \mathcal{F}) = 1$, $T^{Mp}_{(0,0)}(\mathcal{P}, \mathcal{F}) = 1$.
- Select $\Delta_c$ and $\Delta_s$, step size for customer risk and supplier risk respectively, as $\Delta_c \leq 1 - P_{CL}$, $\Delta_s \leq 1 - P_{CL}$.

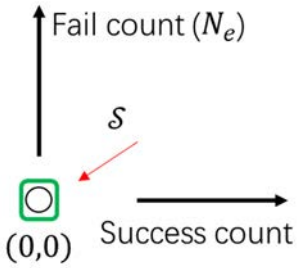

**Figure G.5.2-1: Demonstration of step 1**

Figure G.5.2-1 is the demonstration of step 1. The reason to initialize $= \{(0,0)\}$, $T^{mp}_{(i,j)}(\mathcal{P}, \mathcal{F}) = 1$, $T^{Mp}_{(0,0)}(\mathcal{P}, \mathcal{F}) = 1$ is because the DUT is always in state $(0,0)$ before executing any iteration. And we have $\mathcal{P}, \mathcal{F} = \emptyset$ since no passing state or failure state is selected yet.

**Step 2**: Calculate set $\mathcal{S}'$, the set of the state can be reached after the n+1-th iteration, as $\mathcal{S}' = \{(i,j): (i-1,j) \in \mathcal{S} \text{ or } (i,j-1) \in \mathcal{S}\}$. Then for all state $(i,j) \in \mathcal{S}'$, calculate $T^{Mp}_{(i,j)}(\mathcal{P}, \mathcal{F})$ and $T^{mp}_{(i,j)}(\mathcal{P}, \mathcal{F})$ as follows:

$$T^{Mp}_{(i,j)}(\mathcal{P}, \mathcal{F}) = T^{Mp}_{(i-1,j)}(\mathcal{P}, \mathcal{F})(1 - Mp)\mathbb{I}_{i>0}\mathbb{I}_{(i-1,j)\notin \mathcal{P}\cup\mathcal{F}} + T^{Mp}_{(i,j-1)}(\mathcal{P}, \mathcal{F})Mp\mathbb{I}_{j>0}\mathbb{I}_{(i,j-1)\notin \mathcal{P}\cup\mathcal{F}},$$

$$T^{mp}_{(i,j)}(\mathcal{P}, \mathcal{F}) = T^{mp}_{(i-1,j)}(\mathcal{P}, \mathcal{F})(1 - mp)\mathbb{I}_{i>0}\mathbb{I}_{(i-1,j)\notin \mathcal{P}\cup\mathcal{F}} + T^{mp}_{(i,j-1)}(\mathcal{P}, \mathcal{F})mp\mathbb{I}_{j>0}\mathbb{I}_{(i,j-1)\notin \mathcal{P}\cup\mathcal{F}}.$$

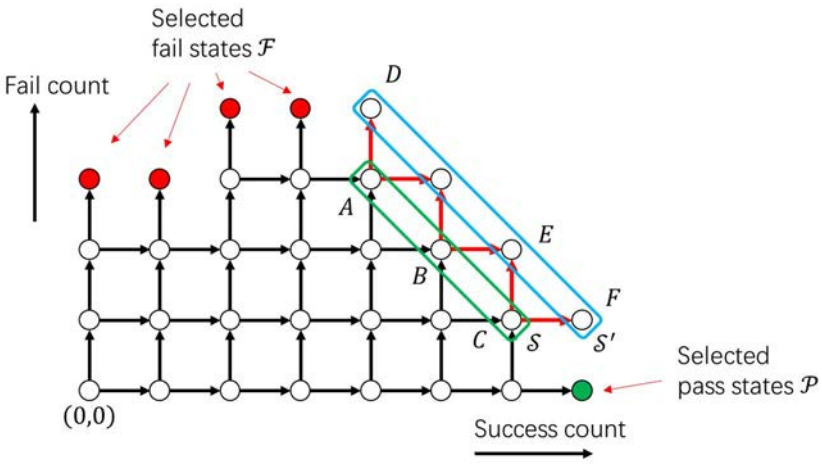

**Figure G.5.2-2: Demonstration of step 2**

See Figure G.5.2-2 for better understanding of step 2. If DUT doesn't pass or fail the test after the n-th iteration then DUT must be in one state in $\mathcal{S}$. It's easy to observe that the DUT must be in one state in $\mathcal{S}'$. Then the transition

probability to state in $\mathcal{S}'$ can be calculated by using Conclusion 3. For example, the only way to move to state $D$ in Figure 2 is to first move to state $A$ then count a fail in the n+1-th iteration, then we have $T_D^p = T_A^p p$. On the other hand, to move to state $E$, the DUT can first move to state $B$ then count a success in the n+1-th iteration or first move to state $C$ then count a fail in the n+1-the iteration, i.e. $T_E^p = T_B^p(1-p) + T_C^p p$.

**Step 3**: First, try finding an integer $n_e$ which satisfies $(n+1-n_e, n_e) \in \mathcal{S}'$, $R_c + \sum_{\substack{(i,j)\in\mathcal{S}' \\ j\le n_e}} T_{(i,j)}^{Mp}(\mathcal{P},\mathcal{F}) \le 1 - P_{CL}$ and $R_s + \sum_{\substack{(i,j)\in\mathcal{S}' \\ j> n_e}} T_{(i,j)}^{mp}(\mathcal{P},\mathcal{F}) \le 1 - P_{CL}$. If such a $n_e$ exists, let

$$R_c = R_c + \sum_{(i,j)\in\mathcal{S}', j\le n_e} T_{(i,j)}^{Mp}(\mathcal{P},\mathcal{F}), \quad R_s = R_s + \sum_{(i,j)\in\mathcal{S}', j> n_e} T_{(i,j)}^{mp}(\mathcal{P},\mathcal{F}),$$

$$\mathcal{P} = \mathcal{P} \cup \{(i,j): (i,j) \in \mathcal{S}', j \le n_e\}, \quad \mathcal{F} = \mathcal{F} \cup \{(i,j): (i,j) \in \mathcal{S}', j > n_e\},$$

If such a $n_e$ doesn't exist, instead try finding integers $n_p$ and $n_f$ which satisfy

$$(n+1-n_p, n_p) \in \mathcal{S}', \quad (n+1-n_f, n_f) \in \mathcal{S}',$$

$$min(i_c\Delta_c, 1-P_{CL}) < R_c + \sum_{(i,j)\in\mathcal{S}', j\le n_p} T_{(i,j)}^{Mp}(\mathcal{P},\mathcal{F}) \le min\big((i_c+1)\Delta_c, 1-P_{CL}\big),$$

$$min(i_s\Delta_s, 1-P_{CL}) < R_s + \sum_{(i,j)\in\mathcal{S}', j\ge n_f} T_{(i,j)}^{mp}(\mathcal{P},\mathcal{F}) \le min\big((i_s+1)\Delta_s, 1-P_{CL}\big).$$

Then,

- if such a $n_p$ exists, set

$$R_c = R_c + \sum_{(i,j)\in\mathcal{S}', j\le n_p} T_{(i,j)}^{Mp}(\mathcal{P},\mathcal{F}), \quad \mathcal{P} = \mathcal{P} \cup \{(i,j): (i,j) \in \mathcal{S}', j \le n_p\}, \quad i_c = i_c + 1.$$

- if such a $n_f$ exists, set

$$R_s = R_s + \sum_{(i,j)\in\mathcal{S}', j\ge n_f} T_{(i,j)}^{mp}(\mathcal{P},\mathcal{F}), \quad \mathcal{F} = \mathcal{F} \cup \{(i,j): (i,j) \in \mathcal{S}', j \ge n_f\}, \quad i_s = i_s + 1.$$

Two possible cases in step 3 are depicted in figure G.5.2-3 and figure G.5.2-4 respectively. If $n_e$ exists, even we add all states $(i,j) \in \mathcal{S}'$ with $j \le n_e$ to $\mathcal{P}$ and all states $(i,j) \in \mathcal{S}'$ with $j > n_e$ to $\mathcal{F}$, the customer risk and supplier risk are still no larger than $1 - P_{CL}$ (the increment of the customer risk and supplier risk, are denoted as blue and green triangle in figure 4 respectively).

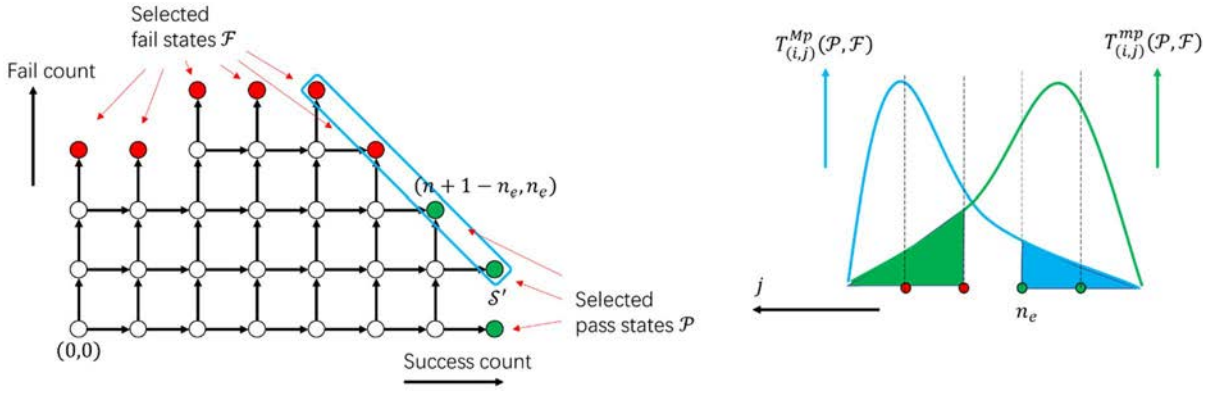

**Figure G.5.2-3: Demonstration of step 3 ($n_e$ exists)**

If $n_e$ doesn't exist, instead we try to find state set $\{(i,j): (i,j) \in \mathcal{S}', j \leq n_p\}$ which satisfies that the total transition probability to any state in the set is approximately $\Delta_c$. If such a set exists we can add states in this set to $\mathcal{P}$ without breaking customer risk threshold. Similarly, we can also try to a state set$\{(i,j): (i,j) \in \mathcal{S}', j \geq n_f\}$ which satisfies that the total transition probability to any state in the set is approximately $\Delta_s$ and add states in this set to $\mathcal{F}$.

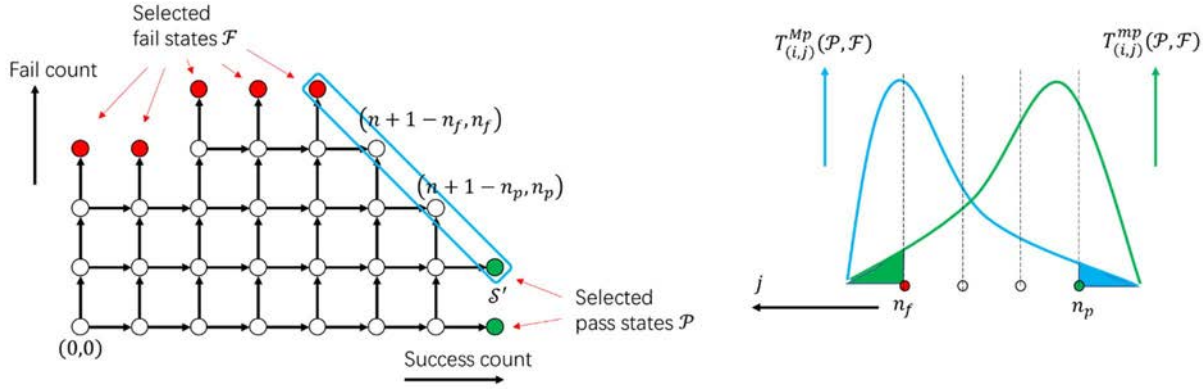

**Figure G.5.2-4: Demonstration of step 3 ($n_e$ doesn't exist)**

**Step 4**: Let $\mathcal{S} = \mathcal{S}' \backslash (\mathcal{P} \cup \mathcal{F})$, $n = n + 1$. Then go back to Step 2 if $\mathcal{S} \neq \emptyset$, otherwise go to Step 5.

If a state $(i,j) \in \mathcal{S}'$ is selected as a passing state or failing state then it's no longer a non-decidable state. Then we need to exclude it from non-decidable state set after n+1-the iteration. If all states in $\mathcal{S}'$ are excluded, clearly the test surely will terminate after the n+1-the iteration and the designing is finished. Otherwise, we need to go back to step 2 and repeat procedures above.

**Step 5**: Sort all states $(i,j)$ in $\mathcal{P}$ in the ascending order of $j$ and all states $(i,j)$ in $\mathcal{F}$ in the ascending order of $i$, i.e. we denote

$$\mathcal{P} = (A_0, 0), (A_1, 1), (A_2, 2), (A_3, 3) \cdots, \qquad \mathcal{F} = (0, B_0), (1, B_1), (2, B_2), (3, B_3), \cdots$$

Then construct passing state set $\mathcal{P}'$ and failure state set $\mathcal{F}'$ as

$$\mathcal{P}' = \{(A'_j, j): j = 0,1,2, \cdots\}, \qquad \mathcal{F}' = \{(i, B'_i): i = 0,1,2 \cdots\}$$

Where $A'_j = \min_{k \geq j} A_k$, $B'_i = \min_{k \geq i} B_i$

Purpose of step 5 is to further optimize the passing state and failure state obtained in step 2 to 4. To understand step 5, we only need to note that all path to passing state $A, B$ must also pass state $C, D$. On the other hand, if a path passes state $D$ or $E$, it must eventually reach one passing state in $A$, $B$ and $C$. Then one can derive that

$$\sum_{(i,j) \in \{A,B,C\}} T^{p}_{(i,j)}(\mathcal{P},\mathcal{F}) = \sum_{(i,j) \in \{A,D,E\}} T^{p}_{(i,j)}(\mathcal{P},\mathcal{F})$$

In other words, if $\mathcal{P} = \{A, B, C\}$ is a passing set which satisfies customer risk requirements, then $\mathcal{P}' = \{A, D, E\}$ is also a passing set satisfying customer risk requirements since it has exactly the same customer risk as $\mathcal{P}$. But $\mathcal{P}'$ is a better choice than $\mathcal{P}$ since it requires fewer iterations to make decision.

For the same reason, we can also derive that failure set $\mathcal{F}' = \{F, G, L, M, N, K\}$ has same supplier risk with $\mathcal{F} = \{F, G, H, I, J, K\}$ but requires fewer iterations to fail the test.

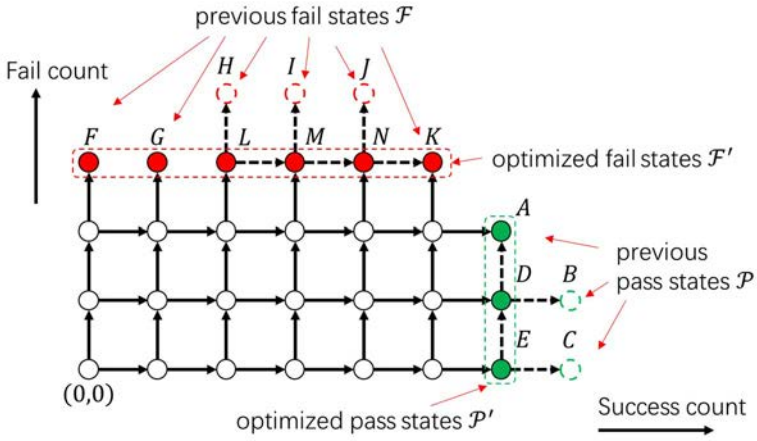

**Figure G.5.2-5: Demonstration of step 3 ($n_e$ doesn't exist).**

**Step 6**: Construct pass limit $\{N_{p,i}\}$ and fail limit $\{N_{f,i}\}$ as follows:

$$N_{f,1} = \max_{B_i=1}(i + B_i), \quad N_{f,2} = \max_{B_i=2}(i + B_i), \quad N_{f,3} = \max_{B_i=3}(i + B_i), \quad \cdots$$

At last, we can convert pass/fail state sets to pass/fail limits by using conclusion 3 in Annex G.5.1.

# Annex I (normative): RRM OTA procedures

Annex I defines the RRM OTA procedures for the permitted testing methodologies defined in [32].

## I.0 Test applicability per permitted test method

The applicability of each permitted test method for the different RRM Angle of Arrival (AoA) setups as defined in Clause A.9 is defined in Table I.0-1.

**Table I.0-1: AoA Test Setup applicability per permitted test method**

| AoA Test Setup | D > 5cm or No declaration | D ≤ 5cm |
|---|---|---|
| Setup 1 | IFF, Enhanced IFF | DFF, IFF, Enhanced IFF, IFF+DFF |
| Setup 2a | IFF, Enhanced IFF | DFF, IFF, Enhanced IFF, IFF+DFF |

## I.1 Direct far field (DFF)

### I.1.1 RX beam peak direction search

The Rx beam peak direction search can be found using any of the following options:

- Same measurement procedure as in clause Annex K.1.2 of TS 38.521-2 [18].
- Any of the procedures described in Annex I.4.

### I.1.2 Search for directions corresponding to the EIS spherical coverage percentile

The test directions corresponding to the EIS spherical coverage percentile can be found using any of the following options:

- EIS spherical coverage scan procedure as described in Annex K.1.6 of TS 38.521-2 [18].
- Any of the procedures described in Annex I.4.

## I.2 Direct far field (DFF) simplification

### I.2.1 RX beam peak direction search

The Rx beam peak direction search can be found using any of the following options:

- Same measurement procedure as in clause Annex K.2.2 of TS 38.521-2 [18].
- Any of the procedures described in Annex I.4.

### I.2.2 Search for directions corresponding to the EIS spherical coverage percentile

The test directions corresponding to the EIS spherical coverage percentile can be found using any of the following options:

- EIS spherical coverage scan procedure as described in Annex K.1.6 of TS 38.521-2 [18].
- Any of the procedures described in Annex I.4.

## I.3 Indirect far field (IFF)

### I.3.1 RX beam peak direction search

The Rx beam peak direction search can be found using any of the following options:

- Same measurement procedure as in clause Annex K.3.2 of TS 38.521-2 [18].
- Any of the procedures described in Annex I.4.

### I.3.2 Search for directions corresponding to the EIS spherical coverage percentile

The test directions corresponding to the EIS spherical coverage percentile can be found using any of the following options:

- EIS spherical coverage scan procedure as described in Annex K.1.6 of TS 38.521-2 [18].
- Any of the procedures described in Annex I.4.

## I.3A Enhanced indirect far field (Enhanced IFF)

### I.3A.1 RX beam peak direction search

Same as in clause I.3.1 for IFF.

### I.3A.2 Search for directions corresponding to the EIS spherical coverage percentile

Same as in clause I.3.2 for IFF.

## I.4 Procedures to search test directions for RRM FR2

### I.4.1 RSRPB-based scan with fallback option to Rx beam peak direction search

This clause provides RSRPB-based scan to find the Rx beam peak of the UE for Setup 1, single AoA cases and one of the test directions for Setup 4. It also provides a method to find test directions fulfilling the EIS Spherical Coverage (TS 38.521-2 [18] clause 7.3.4.3) for Setup 2, 3 and 4. Other approaches are not precluded. RSRPB-based peak beam scan greatly reduces the time to find the peak beam position compared to traditional EIS scan using either constant step size or constant density. The procedure can be used with DFF as well as IFF methodology. The procedure is achieved implementing the following steps:

1. Enable periodic RSRPB reporting from the UE
2. Set of grid points for the UE scan can be user defined set or entire sphere.

3. Set the DL SSB_RP (at the centre of the QZ) to -95 dBm / SCS. For each grid point, record RSRPB first by connecting SS to the DUT through the measurement antenna with $Pol_{Link}$= θ polarization to form the Rx beam towards the measurement antenna.

4. Wait for BEAM_SELECT_WAIT_TIME before recording the RSRPB reports.

4a For each of the grid points, calculate the RSRPB result for $Pol_{Link}$= θ as the linear sum of the 2 RSRPB reports (one per receiver branch).

4b Repeat Steps 3, 4 and 4a with $Pol_{Link}$= ϕ.

5. Once the grid points scan is completed, sort the grid points based on the linear sum of the RSRPB results for $Pol_{Link}$= θ and $Pol_{Link}$= ϕ.

6. For the top 10 grid points, run the REFSENS throughput test as per the test condition defined in TS 38.521-2 [18] clause 7.3.2.

7. Select the grid point with the best REFSENS result among the 10 points from Step 6 as the Rx beam peak for RRM test cases using AoA Setup 1 or 4.

8. Use the EIS result for the RRM beam peak to offset the RSRPB results to obtain an estimate of the EIS Spherical coverage (SC) map.

9. From the EIS map in Step 8, select all the points meeting the EIS SC criteria (as defined in TS 38.521-2 [18] Clause 7.3.4.3) as potential test directions for AoA Setup 2a, 2b, 3 and 4. In order to confirm that the grid point is suitable, run the REFSENS throughput test as per the test condition defined in TS 38.521-2 [18] clause 7.3.2 and verify that the EIS SC criteria is met.

If not enough grid points are found using this method, fallback to using the method in Annex I.1, I.2, I.3 or I.3A as applicable.

## I.5 Re-Positioning Approach for RRM FR2

This clause provides guidance on the applicability of the re-positioning approach which was originally introduced to reduce measurement uncertainties due to positioner blocking as described in Annex N.3 of [18]. Illustrations of the applicability in the following clauses are based on example 1-AoA and 2-AoA capable RRM test systems shown in Figure I.5-1. The probes shown in blue and red are shown for simplicity as typical microwave probes antennas; any of these probes could be implemented as probe&reflector combinations to yield applicable IFF, Enhanced IFF, IFF+DFF test setups, see Clause I.0. The number of locations of the 2 AoA probes are chosen arbitrarily, i.e., systems with fewer and different probe locations are applicable.

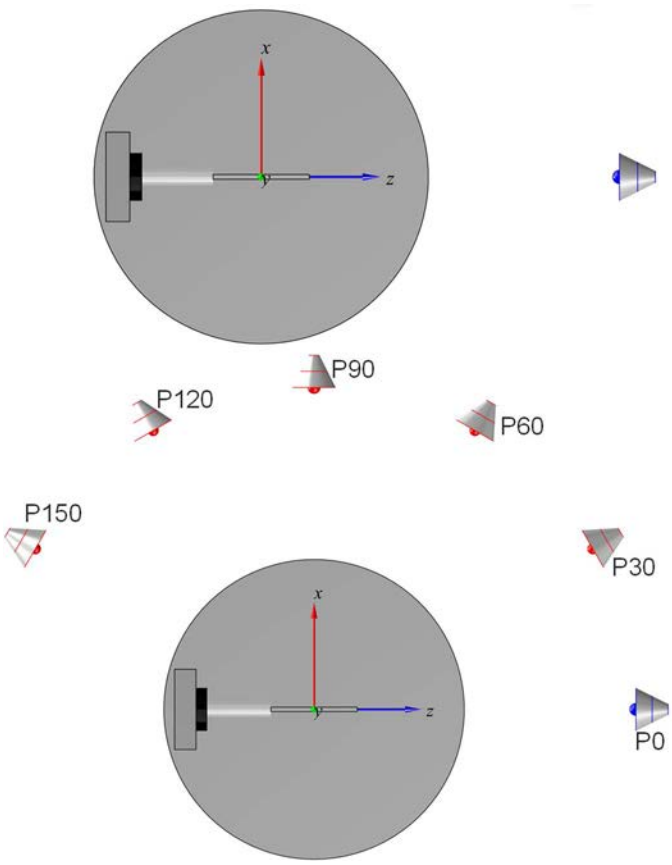

**Figure I.5-1: Example combined-axes RRM system setup to support 1 AoA (top) and 1 AoA & 2 AoA test cases (bottom)**

The re-positioning approach is applicable to RRM test cases if, during the test case, the pedestal is not obstructing the beam path and it is not in closer proximity to the measurement antenna/reflector than the DUT [18], i.e., for the selected DUT alignment options and orientations only the directions of test (AoA) in the upper hemisphere away from the positioner are tested.

## I.5.1 1 AoA Test Cases

The 1 AoA test cases follow Setups 1 and 2, see Clauses A.9.1 and A.9.2, respectively. Here, the re-positioning approach is applicable only when the pedestal is not obstructing the beam path and that the pedestal is not in closer proximity to the measurement antenna/reflector than the DUT. Therefore, for the selected DUT alignment option and orientation, only the upper hemisphere away from the positioner shall be tested for all the test iterations (if applicable), i.e., the positioner shall always be in the back hemisphere of the 1 AoA probe for each test iteration.

This requirement is illustrated next using the example 1 AoA RRM systems from Figure I.5-1. For the example systems in Figure I.5-1 with P0 (shown in blue) used as active probe, the directions of testing (AoA) within the yellow highlighted upper hemisphere shall be considered so the pedestal is not obstructing the beam path. In this case, the re-positioning approach applies and the optimized QoQZ MU is applicable to the assessed MU of the test system. The different test conditions and orientations from Clause N.2 of [18] can be used for each test iteration to prevent the pedestal from obstructing the beam path.

When the directions of testing (AoA) are outside the yellow highlighted upper hemisphere, i.e. the pedestal is obstructing the beam path, the re-positioning approach no longer applies. In this case, the calculated MU for QoQZ shall include the full range of rotation angles described in the QoQZ procedure, Annex O of [18].

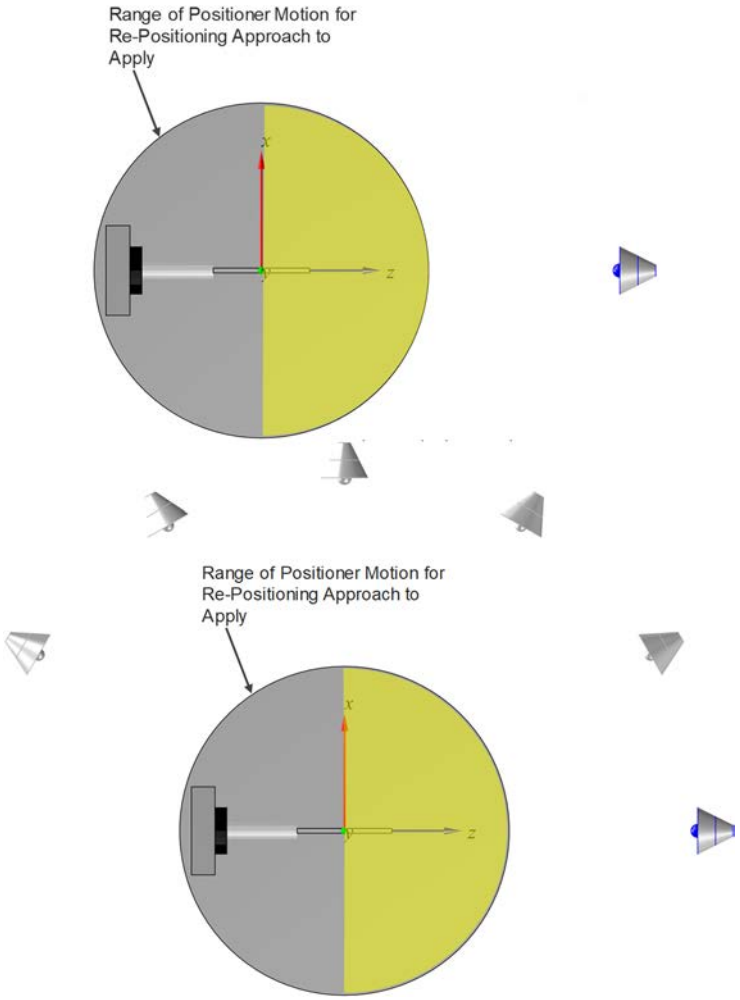

**Figure I.5.1-1: Ranges of possible directions of testing (AoA) for 1 AoA TCs that are applicable with re-positioning concept**

## I.5.2 2 AoA Test Cases

The 2 AoA test cases follow Setups 3 and 4, see Clauses A.9.3 and A.9.4, respectively. Here, the re-positioning approach is applicable only when the pedestal is not obstructing the beam paths between each of the 2 active AoA probes and the pedestal is not in closer proximity to the measurement antennas/reflectors than the DUT. Therefore, for the selected DUT alignment option and orientation, the positioner shall always be in the back hemispheres of each of the active AoA probe for each test iteration.

This requirement is illustrated next using the example 2 AoA RRM system from Figure I.5-1. Figure I.5.2-1 shows the acceptable directions of test for the re-positioner concept separately for each active probe. The directions of testing (AoAs) within the respective yellow highlighted upper hemisphere shall be considered so the pedestal is not obstructing any of the beam paths. In this case, the re-positioning approach applies and the optimized QoQZ MU is applicable to the assessed MU of the test system. The different test conditions and orientations from Clause N.2 of TS 38.521-2 [18] can be used for each test iteration to prevent the pedestal from obstructing the beam paths.

When the directions of testing (AoAs) are outside the yellow highlighted upper hemisphere for at least one active probe, i.e., the pedestal is obstructing at least one beam path, the re-positioning approach no longer applies. In this case, the calculated MU for QoQZ shall include the full range of rotation angles described in the QoQZ procedure, Annex O of [18].
