Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: Thresholds include Test Tolerance applied to fulfil the cell re-selection criterion.

During T1, the cell re-selection delay to a lower priority cell for UE fulfilling stationary relaxed measurements shall be less than 32 s.

The cell re-selection delay to an already detected lower priority cell for UE fulfilling stationary relaxed measurements is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility on Cell 1.

During T2, the cell re-selection delay to an already detected higher priority cell for UE fulfilling stationary relaxed measurements shall be less than 32 s.

The cell re-selection delay to an already detected higher priority cell for UE fulfilling stationary relaxed measurements is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility on Cell 2.

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

NOTE: The cell re-selection delay to a known lower priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap_Relax}$ + $T_{SI-NR}$,

Where:

$T_{evaluate,NR_Inter_RedCap_Relax}$ See Table 4.2B.2.10.2-2 in clause 16.1.1.0.4

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 32 s for the cell re-selection delay to an already detected lower priority cell and 32 s for the cell re-selection delay to an already detected higher priority cell, for UE fulfilling stationary relaxed measurements in the test case.

## 16.1.2 NR – E-UTRA cell re-selection for RedCap

### 16.1.2.0 Minimum conformance requirements

#### 16.1.2.0.1 Minimum conformance requirements for NR SA FR1 - E-UTRA cell re-selection for 1 Rx

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-RAT E-UTRAN layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in TS 38.133 [6] in clause 4.2B.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-RAT E-UTRAN layers of higher, lower priority in preparation for possible re-selection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT E-UTRAN layers shall be the same as that defined below for lower priority RATs.

The requirements in this clause apply for inter-RAT E-UTRAN FDD measurements and E-UTRA TDD measurements. When the measurement rules indicate that inter-RAT E-UTRAN cells are to be measured, the UE shall measure RSRP

and RSRQ of detected E-UTRA cells in the neighbour frequency list at the minimum measurement rate specified in this clause.

The parameter $N_{EUTRA_carrier_RedCap}$ is the total number of configured E-UTRA carriers in the neighbour frequency list. The UE shall filter RSRP and RSRQ measurements of each measured E-UTRA cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,EUTRAN_RedCap}/2$.

An inter-RAT E-UTRA cell is considered to be detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in TS 36.133 [23], Annex B.1.2 are fulfilled for a corresponding band, and

- the same conditions as for inter-frequency RSRQ measurements specified in TS 36.133 [23], Annex B.1.2 are fulfilled for a corresponding band.

- SCH conditions specified in TS 36.133 [23], Annex B.1.2 are fulfilled for a corresponding band

The UE shall be able to evaluate whether a newly detectable inter-RAT E-UTRAN cell meets the re-selection criteria defined in TS 38.304 [30] within $(N_{EUTRA_carrier_RedCap}) * T_{detect,EUTRAN_RedCap}$ when $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$ when $T_{reselection} = 0$ provided that the re-selection criteria are met by a margin of at least 6 dB for RSRP re-selections based on absolute priorities or 4 dB for RSRQ re-selections based on absolute priorities for 2 Rx RedCap and at least 6 dB for RSRP re-selections based on absolute priorities or 4 dB for RSRQ re-selections based on absolute priorities for 1 Rx RedCap.

Cells which have been detected shall be measured at least every $(N_{EUTRA_carrier_RedCap}) * T_{measure,EUTRAN_RedCap}$ when $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,EUTRAN_RedCap}$. If, after detecting a cell in a higher priority search, it is determined that re=selection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of re=selection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects on an inter-RAT E-UTRAN carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT E-UTRA cell in cell re=selection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For a cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met re=selection criterion defined in TS 38.304 [30] within $(N_{EUTRA_carrier_RedCap}) * T_{evaluate,EUTRAN_RedCap}$ when $T_{reselection} = 0$ provided that the re=selection criteria are met by a margin of at least 6 dB for RSRP re-selections based on absolute priorities or 4 dB for RSRQ re-selections based on absolute priorities for 2 Rx RedCap and at least 6 dB for RSRP re-selections based on absolute priorities or 4 dB for RSRQ re-selections based on absolute priorities for 1 Rx RedCap.

If $T_{reselection}$ timer has a non-zero value and the inter-RAT E-UTRA cell is satisfied with the re-selection criteria which are defined in TS 38.304 [30], the UE shall evaluate this E-UTRA cell for the $T_{reselection}$ time. If this cell remains satisfied with the re-selection criteria within this duration, then the UE shall reselect that cell.

For 1 Rx RedCap and 2 Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ are specified in Table 16.1.2.0.1-1.

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ are specified in Table 16.1.2.0.1-2, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and is the same in all PTWs during any of $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ when multiple PTWs are used.

NOTE 5: When eDRX = 20.48 s and DRX = 0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, being configured with eDRX_IDLE cycle, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

### 16.1.2.1.4.2 Test procedure

Two cells are deployed in the test, which are one FR1 NR PCell (Cell 1) and an E-UTRA neighbour cell (Cell 2). The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively.

Before T1 the UE is camped on to Cell 1. During T1, Cell 2 shall be powered off. At the start of T2 the UE is expected to detect Cell 2, send preambles on the PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure on Cell 2. At the start of T3 Cell 2 becomes weaker than Cell 1, and the UE reselects to Cell 1.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR* with Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.
2. Set the parameters according to T1 in Table 16.1.2.1.5-1 and 16.1.2.1.5-2. T1 starts.
3. During T1, Cell 2 shall be powered off and set Cell 2 physical cell identity = ((current Cell 2 physical cell identity + 1) mod 1008 for one iteration of the test procedure loop.
4. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.1.2.1.5-1 and 16.1.2.1.5-2. T2 starts.
5. The SS waits for random access requests information from the UE to perform cell re-selection to a higher priority Cell 2.
6. If the UE responds on Cell 2 during time duration T2 within 68 seconds from the beginning of time period T2, then count a success, continue with step 7. Otherwise, if T2 expires and the UE has not yet re-selected Cell 2, count a fail, and the TE shall switch off and, on the UE, and skip to step 12.
7. The SS shall send an *RRCConnectionRelease* message to ensure that the UE is in state RRC_IDLE on Cell 2.
8. The SS shall switch the power setting from T2 to T3 as specified in Table 16.1.2.1.5-1 and 16.1.2.1.5-2. T3 starts.
9. The SS waits for random access requests information from the UE to perform cell re-selection to a lower priority Cell 1.
10. If the UE has re-selected Cell 1 within T3, after the re-selection or when T3 expires, continue with step 11. Otherwise, if T3 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and, on the UE and skip to step 12.
11. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 1.
12. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR* according to TS 38.508-1 [14] clause 4.5.

### 16.1.2.3.4.2 Test procedure

Two cells are deployed in the test, which are one FR1 NR PCell (Cell 1) and an E-UTRA neighbour cell (Cell 2). The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both NR Cell 1 and E-UTRAN Cell 2 are already identified by the UE prior to the start of the test. E-UTRAN Cell 2 is of lower priority than Cell 1.

The cell reselection delay to a lower priority E-UTRAN cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure on Cell 2.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

2. Set the parameters according to T2 in Table 16.1.2.3.5-1 and 16.1.2.3.5-2. SS waits at least for 32 sec ($T_{detect,EUTRAN}$) to ensure the UE can detect E-UTRA neighbour cell (Cell 2).

3. Set the parameters according to T1 in Table 16.1.2.3.5-1 and 16.1.2.3.5-2. T1 starts.

4. The SS waits for random access requests information from the UE to perform cell re-selection on Cell 2.

5. If the UE responds on Cell 2 during time duration T1 within 8 seconds from the beginning of time period T1 then count a success for the event "re-select lower priority E-UTRA Cell 2" and continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 2, count a failure for the event "re-select lower priority E-UTRA Cell 2", the TE shall switch off and on the UE and skip to step 11.

6 The SS shall send an *RRCConnectionRelease* message to ensure that the UE is in state RRC_IDLE on Cell 2.

7. The SS shall switch the power setting from T1 to T2 as specified in Table 16.1.2.3.5-1 and 16.1.2.3.5-2. T2 starts.

8. The SS waits for random access requests information from the UE to perform cell re-selection on Cell 1.

9. If the UE has re-selected Cell 1 within T2, after the re-selection or when T2 expires, continue with step 10. Otherwise, if T2 expires and the UE has not yet re-selected Cell 1, the TE shall switch off the UE and skip to step 11.

10. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 1.

11. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR* according to TS 38.508-1 [14] clause 4.5.

12. Repeat steps 2-11 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

### 16.1.2.5.4.2 Test procedure

Two cells are deployed in the test, which are one FR1 NR PCell (Cell 1) and an E-UTRA neighbour cell (Cell 2). The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both NR Cell 1 and E-UTRAN Cell 2 are already identified by the UE prior to the start of the test. E-UTRAN Cell 2 is of lower priority than Cell 1.

The UE is configured with the relaxed measurement criterion for UE with low mobility defined in clause 5.2.4.9.1 in TS 38.304 [30]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion is configured according to the parameters listed TS 38.133 [6] in Table A.16.1.1.8.2-3;
- *cellEdgeEvaluationWhileStationary* defined in TS 38.331 [13] criterion is not configured;
- *combineRelaxedMeasCondition2* defined in TS 38.331 [13] is not configured;

The cell reselection delay to a lower priority E-UTRAN cell with UE fulfilling stationary relaxed measurement criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure on Cell 2.

The physical cell identity of Cell 2 does not change throughout the test.1. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR* according to TS 38.508-1 [14] clause 4.5.

1a. Set the parameters according to T2 in Table 16.1.2.5.5-1 and Table 16.1.2.5.5-2. SS waits at least for 113 sec ($T_{detect,EUTRAN_Relax}$ + *t-SearchDeltaP-Stationary-r17*) to ensure the UE can detect E-UTRA neighbor cell (Cell 2).

2. Set the parameters according to T1 in Table 16.1.2.5.5-1 and 16.1.2.5.5-2. T1 starts.

3. The SS waits for random access requests information from the UE to perform cell re-selection on Cell 2.

4. If the UE responds on Cell 2 during time duration T1 within 32 seconds from the beginning of time period T1 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

5. If the UE has re-selected Cell 2 within T1, after the re-selection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and skip to step 11.

6 The SS shall send an *RRCConnectionRelease* to ensure that the UE is in state RRC_IDLE.

7. The SS shall switch the power setting from T1 to T2 as specified in Table 16.1.2.5.5-1 and 16.1.2.5.5-2. T2 starts.

8. The SS waits for random access requests information from the UE to perform cell re-selection on Cell 1.

9. If the UE has re-selected Cell 1 within T2, after the re-selection or when T2 expires, continue with step 10. Otherwise, if T2 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 11.

10 The SS shall send an *RRCRelease* to ensure that the UE is in state RRC_IDLE, and then skip to step 12.

11. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR* according to TS 38.508-1 [14] clause 4.5.

11a. Set the parameters according to T2 in Table 16.1.2.5.5-1 and Table 16.1.2.5.5-2. SS waits at least for 113 sec (Tdetect,EUTRAN_Relax+ *t-SearchDeltaP-Stationary-r17*) to ensure the UE can detect E-UTRA neighbor cell (Cell 2).

12. Repeat steps 2-11 a until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

The cell re-selection delay to a lower priority cell shall be less than 32 s.

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

The cell re-selection delay to a lower priority E-UTRAN cell with UE fulfilling stationary relaxed measurement criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a lower priority cell shall be less than 32 s.

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

# 16.2 RRC_INACTIVE state mobility for RedCap

## 16.2.1 Configured Grant based Small Data Transmissions for RedCap

### 16.2.1.0 Minimum conformance requirements

#### 16.2.1.0.1 Minimum conformance requirements for TA validation using CG-SDT

The requirements in this clause are applicable when the UE is configured with timing alignment (TA) validation using *cg-SDT-RSRP-ChangeThreshold* for transmitting in uplink using CG-SDT as specified in TS 38.331 [13].

The requirements in this clause are applicable for the UE performing small data tranmissions using configured resources as TS 38.331 [13].

The UE is allowed to transmit using the configured uplink resources provided that the UE is synchronized towards (i.e. using the timing derived using the latest available $N_{TA}$ value as specified in subclause 7.1.2) the serving cell prior to transmission. If the UE is not able to obtain the synchronization towards the serving cell then the UE shall drop the small data transmission. The UE determines the small data transmission occasion according to the received CG-SDT configuration as specified in TS 38.331 [13].

When *cg-SDT-RSRP-ChangeThreshold* as specified in TS 38.331 [13] is configured for TA validation based on the RSRP change criterion according to clause 5.8.2 in TS 38.321 [12], the UE is allowed to transmit using CG-SDT using the timing derived using the latest available $N_{TA}$ value as specified in TS 38.133 [6] subclause 7.1 provided that

- the first RSRP ($RSRP_1$) measurement and the second RSRP ($RSRP_2$) measurements used in the TA validation are valid measurements and,
- timing alignment validation for transmission using CG-SDT is valid according to the validation criteria in clause 5.8.2 in TS 38.321 [12].

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in Table 16.2.1.0.1-1 are met for FR1.

**Table 16.2.1.0.1-1 Valid measurement for FR1**

| Measurement | FR1 |
|---|---|
| $RSRP_1$ | $(T1 – \min(640\ ms, M1*T_{DRX})) \leq T1' \leq (T1 + \min(640\ ms, M1*T_{DRX}))$ |
| $RSRP_2$ | $(T2 – \min(640\ ms, M1*T_{DRX})) \leq T2' \leq T2$ |

If at least one of $RSRP_1$ and $RSRP_2$ is considered to be invalid based on the above conditions, then the UE shall not validate the CG-SDT using $RSRP_1$ and $RSRP_2$ and shall not transmit using CG-SDT. Additionally, for the initial CG-SDT transmission, the UE shall not transmit in an CG-SDT occasion that occurs more than 640 ms after T2.

Where:

- T1 is the time when
  - *RRCRelease* with CG-SDT configuration (TS 38.331 [13]) is received, or
  - the latest TA is received if TA is received while in RRC_INACITVE state.
- T1' is the time when the UE has completed $RSRP_1$.
- T2 is the time when the UE performs TA validation as defined in TS 38.321 [12] clause 5.27.2 for transmission using CG-SDT.
- T2' is the time when the UE has completed $RSRP_2$.
- $T_{DRX}$ is the DRX cycle length in ms.
- M1 the scaling factor as defined in TS 38.133 [6] clause 4.2.2.2.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [11] the following restrictions apply due to SS-RSRP/RSRQ measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.
- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on all symbols within SMTC window duration.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* as specified in TS 38.331 [13] the following restrictions apply due to measurement of serving cell.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/ on SSB symbols of the serving cell.

The UE is not required to meet the following measurement requirements during subsequent SDT transmissions:

- Measurements of inter-frequency NR cells in TS 38.133 [6] clause 5.1.2.4
- Measurements of inter-RAT E-UTRAN cells in TS 38.133 [6] clause 5.1.2.5

- Idle Mode CA/DC Measurements in TS 38.133 [6] clause 5.4

The UE is allowed to delay the reception of PRS resources on the positioning frequency layer until the SDT session is completed if the measurement using PRS resource overlaps with the SDT resources.

The normative reference for this requirement is TS 38.133 [6] clauses 5.2B.

# 16.3 RRC_CONNECTED state mobility for RedCap

## 16.3.1 Handover for RedCap

### 16.3.1.0 Minimum conformance requirements

#### 16.3.1.0.1 Minimum conformance requirements for NR – E-UTRAN handover

The requirements in clause 6.3.1.0.1 shall apply when RedCap UE is capable of 2 Rx.

When UE is only required to support 1 Rx antenna, the requirements for category 1bis UE defined in TS 36.133 [23] clause 5.1.2 shall apply.

The normative reference for this requirement is TS 38.133 [6] clause 6.1D.2.1.

#### 16.3.1.0.2 Minimum conformance requirements for NR FR1 – NR FR1 handover

The purpose of NR handover is to change the NR PCell to another NR cell for RedCap UE. The requirements in this clause are applicable to SA NR.

The requirements in this clause apply for the following handover scenarios:

- Handover to a target cell's initial BWP associated with CD-SSB;
- Handover to a target cell's specific Redcap BWP associated with NCD-SSB besides to the initial BWP associated with CD-SSB (i.e. UE directly sync to the NCD-SSB and perform RACH on that BWP).

The requirements in clause 6.3.1.0.2 shall apply when RedCap UE is capable of 2 Rx.

When UE is only required to support 1 Rx antenna, the requirements defined in clause 6.1.1.2 shall apply except that:

- $T_{search}$ is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then $T_{search}$ = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search}$ = 2*$T_{rs}$ ms. If the target cell is an unknown inter-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search}$ = 5* $T_{rs}$ ms. Regardless of whether DRX is in use by the UE, $T_{search}$ shall still be based on non-DRX target cell search times.
- $T_{rs}$ is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise, $T_{rs}$ is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing as NCD-SSB indicated by *nonCellDefiningSSB-r17* if the first active DL BWP included in handover command is configured with *nonCellDefiningSSB-r17*, otherwise, as CD-SSB indicated by *absoluteFrequencySSB* in *frequencyInfoDL* in handover command.
- If the *measObjectNRs* having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, Trs is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, $T_{rs}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

For RedCap UE with HD-FDD, the handover requirements are met provided that

- SSB is available at the UE once every SMTC period during Tsearch
- One SSB is available during $T_{\Delta}$
- One SSB is available during $T_{IU.}$

The normative reference for this requirement is TS 38.133 [6] clause 6.1D.1.2.

## 16.3.1.1 NR SA FR1 handover with known target cell for 1 Rx UE

### 16.3.1.1.1 Test purpose

To verify the requirement for the NR FR1-NR FR1 intra-frequency handover requirements for 1 Rx RedCap UE specified in TS 38.133 [6] clause 6.1D.1.2.

### 16.3.1.1.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

### 16.3.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.3.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.3.1.1.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall start to transmit the PRACH to Cell 2 less than 72 ms from the beginning of time period T3.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [13].

$T_{interrupt}$ = 62 ms in the test. $T_{interrupt}$ is defined in clause 6.1D.1.2.

This gives a total of 72 ms.

### 16.3.1.3 NR SA FR1 handover with unknown target cell for 1 Rx UE

#### 16.3.1.3.1 Test purpose

To verify the requirement for the NR FR1-NR FR1 intra-frequency handover requirements for 1 Rx RedCap as specified in TS 38.133 [6] clause 6.1D.1.2.

#### 16.3.1.3.2 Test applicability

This test applies to all types of NR RedCap UEs with 1 Rx from Release 17 onwards.

#### 16.3.1.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.3.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.3.1.3.

#### 16.3.1.3.4 Test description

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively.

Before the test starts,

- UE is connected to Cell 1 with active DL BWP and active UL BWP
- UE is configured with *nonCellDefiningSSB-r17* under *BWP-DownlinkDedicated* which serves as the reference SSB for the serving cell. The *nonCellDefiningSSB-r17* corresponds to the NCD-SSB within the active DL BWP.

At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives an RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

#### 16.3.1.3.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 16.3.1.3.4.1-1.

2. The power levels and settings for NR Cell 1 are set according to Annex C.1.2 and C.1.3. Cell 2 is NR FR1 target Cell, and its power levels and settings are also set according to Annex C.1.2 and C.1.3.
3. The test parameters are given in Table 16.3.1.3.4.1-3 below.

**Table 16.3.1.3.4.1-3: General test parameters**

| Parameter | | Unit | Value | Comment |

#### 16.3.1.3.4.2 Test procedure

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell and RedCap-specific dedicated BWP of Cell 1 is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value and aligned with channel raster) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where,

- $f_{\mathrm{CDSSB}}$ is the absolute frequency of CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $f_{\mathrm{pointA}}$ is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta\mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-1 [2] clause 5.4.2.1;
- $\mathrm{SCS}_{\mathrm{SSB}}$ is the subcarrier spacing of SSB (in kHz);
- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

2. Set the parameters according to T1 in Table 16.3.1.3.5-1.
3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.
4. SS shall transmit an *RRCReconfiguration* message implying handover to the RedCap-specific dedicated BWP of Cell 2.
5. At the instant when the last TTI containing the *RRCReconfiguration* message in step 4) is sent to the UE, the SS shall switch the power settings from T1 to T2 as specified in Table 16.3.1.3.5-1. T2 starts. The SS also transmits NCD-SSB on Cell 2 with an absolute frequency of $f_{\mathrm{NCDSSB}}$ calculated above.
6. If the UE transmits a PRACH preamble to Cell 2 satisfying the delay requirement specified in clause 16.3.1.3.5 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
7. After T2 expires, the SS shall
   - transmit an *RRCReconfiguration* message to cause the UE handover back to Cell 1. if the handover fails, switch off and on the UE

   or

   - switch off and on the UE.
8. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell and RedCap-specific dedicated BWP of Cell 1 is the activated BWP.
9. Repeat steps 2-8 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

This gives a total of 292 ms.

### 16.3.1.4 NR SA FR1 handover with unknown target cell for 2 Rx UE

#### 16.3.1.4.1 Test purpose

To verify the requirement for the NR FR1-NR FR1 intra-frequency handover requirements for 2 Rx RedCap UE as specified in TS 38.133 [6] clause 6.1D.1.2.

#### 16.3.1.4.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

#### 16.3.1.4.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.3.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.3.1.4.

#### 16.3.1.4.4 Test description

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively.

Before the test starts,

- UE is connected to Cell 1 with active DL BWP and active UL BWP;
- UE is configured with *nonCellDefiningSSB-r17* under *BWP-DownlinkDedicated* which serves as the reference SSB for the serving cell. The *nonCellDefiningSSB-r17* corresponds to the NCD-SSB within the active DL BWP.

At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives an RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

##### 16.3.1.4.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 16.3.1.4.4.1-1.

### 16.3.1.4.4.2 Test procedure

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell and RedCap-specific dedicated BWP of Cell 1 is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value and aligned with channel raster) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where,

- $f_{\mathrm{CDSSB}}$ is the absolute frequency of CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $f_{\mathrm{pointA}}$ is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta\mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-1 [2] clause 5.4.2.1;
- $\mathrm{SCS}_{\mathrm{SSB}}$ is the subcarrier spacing of SSB (in kHz);
- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

2. Set the parameters according to T1 in Table 16.3.1.4.5-1.
3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message implying handover to the RedCap-specific dedicated BWP of Cell 2.

5. At the instant when the last TTI containing the *RRCReconfiguration* message in step 4) is sent to the UE, the SS shall switch the power settings from T1 to T2 as specified in Table 16.3.1.4.5-1. T2 starts. The SS also transmits NCD-SSB on Cell 2 with an absolute frequency of $f_{\mathrm{NCDSSB}}$ calculated above.

6. If the UE transmits a PRACH preamble to Cell 2 satisfying the delay requirement specified in clause 16.3.1.4.5 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

7. After T2 expires, the SS shall

   - transmit an *RRCReconfiguration* message to cause the UE handover back to Cell 1. if the handover fails, switch off and on the UE

   or

   - switch off and on the UE.

8. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell and RedCap-specific dedicated BWP of Cell 1 is the activated BWP.

9. Repeat steps 2-8 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

16.3.1.5.4.2 Test procedure

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell.

2. Set the parameters according to T1 in Table 16.3.1.5.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 1) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message implying handover to the RedCap-specific dedicated BWP of Cell 2.

5. At the instant when the last TTI containing the *RRCReconfiguration* message in step 4) is sent to the UE, the SS shall switch the power settings from T1 to T2 as specified in Table 16.3.1.5.5-1. T2 starts. The SS transmits NCD-SSB on Cell 2 with an absolute frequency (in ARFCN value and aligned with channel raster) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where,

- $f_{\mathrm{CDSSB}}$ is the absolute frequency of CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $f_{\mathrm{pointA}}$ is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta\mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-1 [2] clause 5.4.2.1;

- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

6. If the UE transmits a PRACH preamble to Cell 2 satisfying the delay requirement specified in clause 16.3.1.5.5 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

7. After T2 expires, the SS shall

   - transmit an *RRCReconfiguration* message to cause the UE handover back to Cell 1. if the handover fails, switch off and on the UE

   or

   - switch off and on the UE.

8. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.

9. Repeat steps 2-8 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

Note 8: The starting PRB index for dedicated UL BWP is the same as the dedicated DL BWP corresponding to NCD-SSB PRB index;

The handover delay is measured from the beginning of time period T2 to the time that the UE transmit the first PRACH to Cell 2. The handover delay shall be no larger than: RRC procedure delay + $T_{interrupt}$, where:

- RRC procedure delay = 10 ms, is the RRC processing delay specified in TS 38.331 [13] clause 12,
- $T_{interrupt}$ = 522 ms, is the interruption time specified in TS 38.133 [6] clause 6.1D.1.2.

This gives a total of 532 ms.

## 16.3.1.6 NR SA FR1-FR1 handover with unknown target cell for 2 Rx UE

### 16.3.1.6.1 Test purpose

To verify the requirement for the NR FR1-NR FR1 inter-frequency handover requirements for 2 Rx RedCap UE as specified in TS 38.133 [6] clause 6.1D.1.2.

### 16.3.1.6.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

### 16.3.1.6.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.3.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.3.1.6.

### 16.3.1.6.4 Test description

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives an RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP, where Cell 2's DL BWP is the Redcap specific BWP associated with NCD-SSB, then UE handover from Cell 1's CD-SSB to Cell 2's specific Redcap BWP associated with NCD-SSB. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

#### 16.3.1.6.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 16.3.1.6.4.1-1.

The handover delay is measured from the beginning of time period T2 to the time that the UE transmit the first PRACH to Cell 2. The handover delay shall be no larger than: RRC procedure delay + $T_{interrupt}$, where:

- RRC procedure delay = 10 ms, is the RRC processing delay specified in TS 38.331 [13] clause 12,
- $T_{interrupt}$ = 362 ms, is the interruption time specified in TS 38.133 [6] clause 6.1D.1.2.

This gives a total of 372 ms.

## 16.3.2.2 Random access for RedCap

### 16.3.2.2.0 Minimum conformance requirements

#### 16.3.2.2.0.1 Minimum conformance requirements for Contention based random access

The 4-step and 2-step random access requirements described in clause 6.3.2.2.0.1 are applicable for TDD and FDD RedCap UEs.

The 4-step and 2-step RA requirements for contention based random access defined in clause 6.3.2.2.0.1 apply to HD-FDD UE with the following conditions:

- The RedCap UE operating in HD-FDD mode is not expected to perform PRACH transmission on a PRACH resource of a cell if UE has not received at least one SSB associated with that PRACH resource during the last $T_p$ period in the cell, where $T_p$ = 160 ms.

- The RedCap UE operating in HD-FDD mode shall meet the PRACH requirements when performing PRACH transmission on a PRACH resource of a cell provided that the UE has received at least one SSB associated with that PRACH resource during the last $T_p$ period before the PRACH transmission, where $T_p$ = 160 ms.

The normative reference for this requirement is TS 38.133 [6] clauses 6.2.2B.

# 16.4 Timing for RedCap

## 16.4.1 UE transmit timing for RedCap

### 16.4.1.0 Minimum conformance requirements

#### 16.4.1.0.1 Minimum conformance requirements for UE transmit timing accuracy

The UE initial transmission timing error shall be less than or equal to $\pm T_e$ where the timing error limit value $T_e$ is specified in Table 16.4.1.0.1-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission.

The UE shall meet the $T_e$ requirement for an initial transmission provided that at least one SSB (CD-SSB or NCD-SSB) is available at the UE during the last 160 ms on the condition that:

the SSB is within the UE's active BWP, or

the SSB is not within the UE's active BWP, and the measurement gap is configured

The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_c$. The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the UE to determine downlink timing is received from the reference cell at UE antenna. $N_{\mathrm{TA}}$ for PRACH is defined as 0.

$(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_c$ (in $T_c$ units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in TS 38.133 [6] clause 7.3A was applied. $N_{\mathrm{TA}}$ for other channels is not changed until next timing advance is received. The value of $N_{\mathrm{TA\ offset}}$ depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR). $N_{\mathrm{TA\ offset}}$ is defined in Table 16.4.1.0.1-2.

**Table 16.4.1.0.1-1: $T_e$ Timing Error Limit**

| Frequency Range | SCS of SSB signals (kHz) | SCS of uplink signals (kHz) | $T_e$ |
|---|---|---|---|
| 1 | 15 | 15 | $12*64*T_c$ |

| | | | |
|---|---|---|---|
| | | 30 | 10*64*$T_c$ |
| | | 60 | 10*64*$T_c$ |
| | 30 | 15 | 8*64*$T_c$ |
| | | 30 | 8*64*$T_c$ |
| | | 60 | 7*64*$T_c$ |
| Note 1: $T_c$ is the basic timing unit defined in TS 38.211 [7] | | | |

**Table 16.4.1.0.1-2: The Value of $N_{\text{TA offset}}$**

| Frequency range and band of cell used for uplink transmission | $N_{\text{TA offset}}$ (Unit: $T_c$) |
|---|---|
| FR1 FDD or TDD band with neither E-UTRA–NR nor NB-IoT–NR coexistence case | 25600 (Note 1) |
| FR1 FDD band with E-UTRA–NR and/or NB-IoT–NR coexistence case | 0 (Note 1) |
| FR1 TDD band with E-UTRA–NR and/or NB-IoT–NR coexistence case | 39936 (Note 1) |
| FR2 | 13792 |
| Note 1: The UE identifies $N_{\text{TA offset}}$ based on the information *n-TimingAdvanceOffset* as specified in TS 38.331 [13]. If UE is not provided with the information *n-TimingAdvanceOffset*, the default value of $N_{\text{TA offset}}$ is set as 25600 for FR1 band.<br>Note 2: Void | |

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH and SRS transmission, the UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell except when the timing advance in TS 38.133 [6] clause 7.3A is applied.

When the transmission timing error between the UE and the reference timing exceeds $\pm T_e$ then the UE is required to adjust its timing to within $\pm T_e$. The reference timing shall be $(N_{\text{TA}} + N_{\text{TA offset}}) \times T_c$ before the downlink timing of the reference cell. All adjustments made to the UE uplink timing shall follow these rules:

1) The maximum amount of the magnitude of the timing change in one adjustment shall be $T_q$.

2) The minimum aggregate adjustment rate shall be $T_p$ per second.

3) The maximum aggregate adjustment rate shall be $T_q$ per 200 ms.

   where the maximum autonomous time adjustment step $T_q$ and the aggregate adjustment rate $T_p$ are specified in Table 16.4.1.0.1-3.

**Table 16.4.1.0.1-3: $T_q$ Maximum Autonomous Time Adjustment Step and $T_p$ Minimum Aggregate Adjustment rate**

| Frequency Range | SCS of uplink signals (kHz) | $T_q$ | $T_p$ |
|---|---|---|---|
| 1 | 15 | 5.5*64*$T_c$ | 5.5*64*$T_c$ |
| | 30 | 5.5*64*$T_c$ | 5.5*64*$T_c$ |
| | 60 | 5.5*64*$T_c$ | 5.5*64*$T_c$ |
| NOTE: $T_c$ is the basic timing unit defined in TS 38.211 [7] | | | |

The normative reference for this requirement is TS.38.133 [6] clause 7.1A.

# 16.4.2

# 16.4.3 Timing advance for RedCap

## 16.4.3.0 Minimum conformance requirement

The timing advance is initiated from gNB to UE configured with only PCell, with MAC message that implies the adjustment of the timing advance, as defined in TS 38.321 [12] clause 5.2.

UE shall adjust the timing of its uplink transmission at time slot n+k+1 for a timing advance command received in time slot n, and the value of k is defined in TS 38.213 [8] clause 4.2. The same requirement applies also when the UE is not able to transmit a configured uplink transmission due to the channel assessment procedure.

The UE shall adjust the timing of its transmissions with a relative accuracy better than or equal to the UE Timing Advance adjustment accuracy requirement in Table 16.4.3.0-1, to the signalled timing advance value compared to the timing of preceding uplink transmission. The timing advance command step is defined in TS 38.213 [8].

| UE Timing Advance adjustment accuracy | ±256 $T_c$ | ±256 $T_c$ |

## 16.4.3.1 NR SA FR1 timing advance adjustment accuracy for 1 Rx UE

### 16.4.3.1.1 Test purpose

To verify UE timing advance adjustment delay and accuracy requirement defined in TS 38.133 [6] clause 7.3A.

### 16.4.3.1.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

### 16.4.3.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 16.4.3.0.

The normative reference for this requirement is TS 38.133 [6] clause A.16.4.3.1.

# 16.5 Signalling characteristics for RedCap

## 16.5.1 Radio link monitoring for RedCap

### 16.5.1.0 Minimum requirements

#### 16.5.1.0.1 General

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [8]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP. The SSB and SMTC in this section applies for both CD-SSB and NCD-SSB if it is not additional specified.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out}$ and $Q_{in}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in Table 16.5.1.0.1-1. For SSB based radio link monitoring, $Q_{out_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 16.5.1.0.1-2. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 16.5.1.0.1-4.

The threshold $Q_{in}$ is defined as the level at which the downlink radio link quality can be significantly more reliably received than at $Q_{out}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in Table 16.5.1.0.1-1. For SSB based radio link monitoring, $Q_{in_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 16.5.1.0.1-3. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 16.5.1.0.1-5.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *RLM-IS-OOS-thresholdConfig* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in Table 16.5.1.0.1-1 as default. All requirements here are applicable for BLER Configuration #0 in Table 16.5.1.0.1-1.

**Table 16.5.1.0.1-1: Out-of-sync and in-sync block error rates**

| Configuration | $BLER_{out}$ | $BLER_{in}$ |
|---|---|---|
| 0 | 10% | 2% |

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [8], where $N_{RLM}$ is specified in Table 16.5.1.0.1-6 according TS 38.213 [8], and meet the requirements as specified in TS 38.133 [6] clause 8.1B. UE is not required to meet the requirements in TS 38.133 [6] clause 8.1B if RLM-RS is not configured and no TCI state for PDCCH is activated.

When the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource during one evaluation period, the UE is allowed to restart the ongoing evaluation using the second SSB type after BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

The requirements in TS 38.133 [6] clause 8.1.4 shall also apply except the scenarios described above.

The requirements in TS 38.133 [6] clause 8.1.5 shall apply.

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out}$, Layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A Layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [13].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,RedCap}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [13].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [8]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,RedCap}$.

When DRX is not used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in clause TS 38.133 [6] 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in TS 38.133 [6] clause 8.1B.3 if the RLM-RS resource is CSI-RS.

In case DRX is used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX cycle_length is less than or equal to 320 ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX cycle_length is greater than 320 ms. Upon start of T310 timer as specified in TS 38.331 [13], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

When DRX is not used for HD-FDD RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in TS 38.133 [6] clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in TS 38.133 [6] clause 8.1B.3 if the RLM-RS resource is CSI-RS, under the following condition

- For each RLM-RS configuration, at least one RLM-RS sample must fall with DL occasion within an indication period.

In case DRX is used for HD-FDD RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX cycle_length is less than or equal to 320 ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX cycle_length is greater than 320 ms, under the following condition

- For each RLM-RS configuration, at least one RLM-RS sample must fall with DL occasion within an indication period.

The requirements in TS 38.133 [6] clause 8.1.7 shall apply.

The normative reference for this requirement is TS 38.133 [6] clauses 8.1B.1, 8.1B.2, 8.1B.3, 8.1B.4, 8.1B.5, 8.1B.6 and 8.1B.7.

#### 16.5.1.0.2 Minimum conformance requirements for SSB-based RLM

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in this clause.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,RedCap}$ ms period becomes worse than the threshold $Q_{out_SSB,RedCap}$ within $T_{Evaluate_out_SSB,RedCap}$ ms evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,RedCap}$ ms period becomes better than the threshold $Q_{in_SSB,RedCap}$ within $T_{Evaluate_in_SSB,RedCap}$ ms evaluation period.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in Table 16.5.1.0.2-1 and Table 16.5.1.0.2-2 for FR1 for UE with 2 Rx RedCap and 1 Rx RedCap, respectively.

**Table 16.5.1.0.2-1: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ for FR1 for 2 Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(10 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle ≤320 ms | Max(200, Ceil(15 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(10 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

**Table 16.5.1.0.2-2: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ for FR1 for 1 Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(400, Ceil(20 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle ≤ 320 ms | Max(400, Ceil(30 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(20 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

Longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

The normative reference for this requirement is TS 38.133 [6] clauses 8.1B.2.

#### 16.5.1.0.3 Minimum conformance requirements for CSI-RS based RLM

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in this clause. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS,RedCap}$ ms period becomes worse than the threshold $Q_{out_CSI-RS,RedCap}$ within $T_{Evaluate_out_CSI-RS,RedCap}$ ms evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS,RedCap}$ ms period becomes better than the threshold $Q_{in_CSI-RS,RedCap}$ within $T_{Evaluate_in_CSI-RS,RedCap}$ ms evaluation period.

$T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ are defined in Table 16.5.1.0.3-1 and Table 16.5.1.0.3-2 for FR1 for RedCap 2 Rx RedCap and 1 Rx RedCap, respectively.

**Table 16.5.1.0.3-1: Evaluation period $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ for FR1 for 2 Rx RedCap UE**

| Configuration | $T_{Evaluate_out_CSI-RS,RedCap}$ (ms) | $T_{Evaluate_in_CSI-RS,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out,RedCap}$×P)×$T_{CSI-RS}$) | Max(100, Ceil($M_{in,RedCap}$×P) × $T_{CSI-RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out,RedCap}$ ×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) | Max(100, Ceil(1.5×$M_{in,RedCap}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) |
| DRX > 320 ms | Ceil($M_{out,RedCap}$ ×P) × $T_{DRX}$ | Ceil($M_{in,RedCap}$ ×P) × $T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

**Table 16.5.1.0.3-2: Evaluation period $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ for FR1 for 1 Rx RedCap UE**

| Configuration | $T_{Evaluate_out_CSI-RS,RedCap}$ (ms) | $T_{Evaluate_in_CSI-RS,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(400, Ceil($M_{out,RedCap}$×P)×$T_{CSI-RS}$) | Max(100, Ceil($M_{in,RedCap}$×P) × $T_{CSI-RS}$) |
| DRX ≤ 320 ms | Max(400, Ceil(1.5×$M_{out,RedCap}$ ×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) | Max(100, Ceil(1.5×$M_{in,RedCap}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) |
| DRX > 320 ms | Ceil($M_{out,RedCap}$ ×P) × $T_{DRX}$ | Ceil($M_{in,RedCap}$ ×P) × $T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

Longer evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

## 16.5.2 Beam Failure Detection and Link recovery procedures for RedCap

### 16.5.2.0 Minimum requirements

#### 16.5.2.0.1 General

The Redcap UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\overline{q}_0$ as specified in TS 38.213 [8] in order to detect beam failure on PCell in SA. The SSB and SMTC in this section applies for both CD-SSB and NCD-SSB if it is not additional specified.

The RS resource configurations in the set $\overline{q}_0$ on PCell can be periodic CSI-RS resources and/or SSBs. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in TS 38.133 [6] clauses 8.5B.2 and 8.5B.3 if UE does not have set $\overline{q}_0$ .

On each RS resource configuration in the set $\overline{q}_0$ , the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR_Redcap}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold $Q_{out_LR_Redcap}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\overline{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10% block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 16.5.2.0.1-1. For CSI-RS based beam failure detection, $Q_{out_LR_CSI-RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 16.5.2.0.1-2.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}$ as specified in TS 38.213 [8] to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR_RedCap}$ , which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR_RedCap}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR_RedCap}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set $\bar{q}$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. UE is not required to perform candidate beam detection outside the active DL BWP.

When the radio link quality on all the RS resources in set $\bar{q}_0$ is worse than $Q_{out_LR_Redcap}$, layer 1 of the UE shall send a beam failure instance indication to the higher layers.

The beam failure instance evaluation for the RS resources in set $\bar{q}_0$ shall be performed as specified in TS 38.213 [8] clause 6. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval_BFD_Redcap}$.

When DRX is not used, $T_{Indication_interval_BFD_Redcap}$ is max(2 ms, $T_{SSB\text{-}RS,M}$) ) or max(2 ms, $T_{CSI\text{-}RS,M}$), where $T_{SSB\text{-}RS,M}$ and $T_{CSI\text{-}RS,M}$ is the shortest periodicity of all RS resources in set $\bar{q}_0$ for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set $\bar{q}_0$ or CSI-RS resource in the set $\bar{q}_0$ .

When DRX is used, for SSB based link quality measurement,

- $T_{Indication_interval_BFD_Redcap}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{SSB\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD_Redcap}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

When DRX is used, for CSI-RS based link quality measurement,

- $T_{Indication_interval_BFD_Redcap}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{CSI\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD_Redcap}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

For HD-FDD UE, the above conditions and requirements $T_{Indication_interval_BFD_Redcap}$ apply given that for each BFD-RS configuration, at least one BFD-RS sample must fall with DL occasion within an indication period.

There are no scheduling restrictions due to beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1.

For UEs which support *simultaneousRxDataSSB-DiffNumerology* defined in TS 38.331 [13] there are no restrictions on scheduling availability due to beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* defined in TS 38.331 [14] the following restrictions apply due to beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for beam failure detection.

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1.

For UEs which support *simultaneousRxDataSSB-DiffNumerology* defined in TS 38.331 [13] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as link recovery detection resource. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* defined in TS 38.331 [13] the following restrictions apply due to L1-RSRP measurement based on SSB configured as link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

When the UE transitions between BFD CD-SSB resource and BFD NCD-SSB resource during one evaluation period, the UE is allowed to restart the ongoing evaluation using the second SSB type after BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each BFD-RS resource.

The requirements in TS 38.133 [6] clause 8.5.10 shall also apply except the scenarios described above.

The normative reference for this requirement is TS 38.133 [6] clauses 8.5B.1, 8.5B.2, 8.5B.3, 8.5B.4, 8.5B.6, 8.5B.8 and 8.5B.9.

#### 16.5.2.0.2 Minimum conformance requirements for SSB-based BFD and CBD

The requirements in this clause apply for each SSB resource in the set $\overline{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in Table 16.5.2.0.2-1.

The requirements in this clause apply for each SSB resource in the set $\overline{q}_1$ configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in Table 16.5.2.0.2-2.

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\overline{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB_Redcap}$ ms period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB_Redcap}$ ms period.

The value of $T_{Evaluate_BFD_SSB_Redcap}$ is defined in Table 16.5.2.0.2-1 for FR1.

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet pervious conditions.

For an FR1 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For an FR1 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 16.5.2.0.2-1: Evaluation period $T_{Evaluate_BFD_SSB_Redcap}$ for FR1**

| Configuration | $T_{Evaluate_BFD_SSB_Redcap}$ (ms) for Redcap UE with 2 Rx | $T_{Evaluate_BFD_SSB_Redcap}$ (ms) for 1 Rx Redcap |
|---|---|---|
| no DRX | Max(50, Ceil(5 × P) × $T_{SSB}$) | [ Max(50, Ceil(10 × P) × $T_{SSB}$)] |
| DRX cycle ≤ 320 ms | Max(50, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) | [ Max(50, Ceil(15 × P) × Max($T_{DRX}$,$T_{SSB}$)) ] |
| DRX cycle > 320 ms | Ceil(5 × P) × $T_{DRX}$ | [ Ceil(10 × P) × $T_{DRX}$] |
| Note: $T_{SSB}$ is the periodicity of SSB in the set $\overline{q}_0$ . $T_{DRX}$ is the DRX cycle length. | | |

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

The UE shall monitor the configured SSB resources using the evaluation period in Table 16.5.2.0.2-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB_Redcap}$ is defined in Table 16.5.2.0.2-2 for FR1.

where,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise, $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet pervious conditions.

For an FR1 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For an FR1 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $P_{CBD}$ used in Table 16.5.2.0.2-2 are defined as

For each SSB resource in the set $\overline{q}_1$ configured for PCell

- $P_{CBD}$ = 1.

**Table 16.5.2.0.2-2: Evaluation period $T_{Evaluate_CBD_SSB_Redcap}$ for FR1**

| Configuration | $T_{Evaluate_CBD_SSB_Redcap}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | Max(25, Ceil(3 × P × $P_{CBD}$) × $T_{SSB}$) |
| DRX cycle > 320 ms | Ceil(3 × P × $P_{CBD}$) × $T_{DRX}$ |
| Note: $T_{SSB}$ is the periodicity of SSB in the set $\overline{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

The normative reference for this requirement is TS 38.133 [6] clauses 8.5B.2 and 8.5B.5.

### 16.5.2.0.3 Minimum conformance requirements for CSI-RS based RLM

The requirements in this clause apply for each CSI-RS resource in the set $\overline{q}_0$ of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set $\overline{q}_0$ for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in Table 16.5.2.0.3-1.

The requirements in this clause apply for each CSI-RS resource in the set $\overline{q}_1$ configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in Table 16.5.2.0.3-2.

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\overline{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI-RS_Redcap}$ ms period becomes worse than the threshold $Q_{out_LR_CSI-RS}$ within $T_{Evaluate_BFD_CSI-RS_Redcap}$ ms period.

The value of $T_{Evaluate_BFD_CSI-RS_Redcap}$ is defined in Table 16.5.2.0.3-1 for FR1.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Note: The overlap between CSI-RS for BFD and SMTC means that CSI-RS for BFD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet pervious conditions.

For an FR1 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For an FR1 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{BFD}$ used in Table 16.5.2.0.3-1 are defined as

- $M_{BFD}$ = 10, if the CSI-RS resource(s) in set $\overline{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{BFD}$ used in Table 16.5.2.0.3-1 are defined as

For each CSI-RS resource in the set $\bar{q}_0$ configured for PCell

- $P_{BFD} = 1$.

**Table 16.5.2.0.3-1: Evaluation period $T_{Evaluate_BFD_CSI\text{-}RS_Redcap}$ for FR1**

|---|---|---|
| no DRX | Max(50, Ceil($M_{BFD} \times P \times P_{BFD}$) × $T_{CSI\text{-}RS}$) | Max(50, Ceil(2×$M_{BFD} \times P \times P_{BFD}$) × $T_{CSI\text{-}RS}$) |
| DRX cycle ≤ 320 ms | Max(50, Ceil(1.5 × $M_{BFD} \times P \times P_{BFD}$) × Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) | Max(50, Ceil(2×1.5 × $M_{BFD} \times P \times P_{BFD}$) × Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) |
| DRX cycle > 320 ms | Ceil($M_{BFD} \times P \times P_{BFD}$) × $T_{DRX}$ | Ceil(2×$M_{BFD} \times P \times P_{BFD}$) × $T_{DRX}$ |
| Note: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | | |

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following scenarios.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ ms period becomes better than the threshold $Q_{in_LR_RedCap}$ within $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ ms period provided CSI-RS Ês/Iot is according to TS 38.133 [6] Annex Table B.2.4.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in Table 16.5.2.0.3-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ is defined in Table 16.5.2.0.3-2 for FR1.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise, $T_{SMTCperiod}$ follows *smtc1*.

Note: The overlap between CSI-RS for CBD and SMTC means that CSI-RS for CBD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet pervious conditions.

Longer evaluation period would be expected if the CSI-RS is on the same OFDM symbols with RLM, BFD, BM-RS, or other CBD-RS, according to the measurement restrictions defined in clause 8.5.6.3.

For an FR1 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For an FR1 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{CBD}$ used in Table 16.5.2.0.3-2 are defined as

- $M_{CBD}$ = 3, if the CSI-RS resource configured in the set $\bar{q}_1$ is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{CBD}$ used in Table 16.5.2.0.3-2 are defined as

For each CSI-RS resource in the set $\bar{q}_1$ configured for PCell

- $P_{CBD}$ = 1.

| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{CSI-RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{DRX}$ |
| Note: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

## 16.5.2.2 NR SA FR1 Beam Failure Detection and Link Recovery Test for FR1 PCell configured with SSB-based BFD and LR in non-DRX mode for 2 Rx UE

### 16.5.2.2.1 Test purpose

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set $q_0$ configured for a serving cell and that the UE performs correct SSB-based link recovery based on beam candidate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR1 serving cell requirements in TS 38.133 [6] clause 8.5B.

### 16.5.2.2.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from release 17 onwards and supporting link recovery.

## 16.5.3 Active BWP switch delay for RedCap

### 16.5.3.1 DCI-based and timer-based active BWP switch for RedCap

#### 16.5.3.1.0 Minimum conformance requirements

##### 16.5.3.1.0.1 Minimum conformance requirements for DCI-based and time-based active BWP switch for RedCap

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y = 0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.

- Y equals to the length of 1 slot, if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell. In this scenario, $T_{BWPswitchDelay}$ + Y shall follow the smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (FR1) or DL half-subframe (FR2) immediately after a BWP-inactivity timer *bwp-InactivityTimer* defined in TS 38.331 [13] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit

PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* defined in TS 38.331 [13] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* defined in TS 38.331 [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in Table 16.5.3.1.0.1-1.

**Table 16.5.3.1.0.1-1: BWP switch delay**

| $\mu$ | NR Slot length (ms) | BWP switch delay $T_{BWPswitchDelay}$ (slots) | |
|---|---|---|---|
| | | Type 1[Note 1] | Type 2[Note 1] |
| 0 | 1 | 1 | 3 |
| 1 | 0.5 | 2 | 5 |
| 2 | 0.25 | 3 | 9 |
| 3 | 0.125 | 6 | 18 |
| Note 1: Depends on UE capability.<br>Note 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. | | | |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in TS 38.133 [6] Clause 8.10 in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in TS 38.133 [6] Clause 8.10 in the new BWP.

If the BWP switch is triggered within or outside DRX active time, and one of the two BWPs in a BWP switching is a dormant BWP defined in TS 38.321 [12], UE shall be able to complete active BWP switching within the time duration of

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, or
- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X + Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where
- $T_{BWPswitchDelay}$ is defined in Table 16.5.3.1.0.1-1 corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.
- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.
- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where UE receives dormancy indication.

For DCI-based BWP switch, if the new BWP is a dormant BWP, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive CSI-RS (for DL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL slot occurs right after a time duration of $T_{dormantBWPswitchDelay}$ which starts from the beginning of DL slot n.

Note 1: OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: For unpaired spectrum, a DL BWP is linked with an UL BWP. DLBWP.0.2 is linked with ULBWP.0.2; DLBWP.1.1 is linked with ULBWP.1.1; DLBWP.1.1 RedCap is linked with ULBWP.1.1 RedCap defined in clause 12 of TS 38.213 [8].

During T1, the UE shall start to send the ACK/NACK for Cell 1 from the first UL slot that occurs after the beginning of DL slot ($i+T_{BWPswitchDelay}+k1$).

During T3, the UE shall start to send the ACK/NACK for Cell 1 from the first UL slot that occurs after the beginning of DL slot ($j+T_{BWPswitchDelay}+k1$).

Where, $k1$ is the timing between DL data receiving and acknowledgement as specified in TS 38.321 [12].

Depending on UE capability *bwp-SwitchingDelay* as specified in TS 38.331 [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in Table 16.5.3.1.0.1-1.

All of the above test requirements shall be fulfilled in order for the observed Cell 1 active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK/NACK in the first UL slot that occurs after beginning of DL slot ($i+T_{BWPswitchDelay}+k1$), ($j+T_{BWPswitchDelay}+k1$), then the UE shall use the next available uplink resource for reporting the corresponding ACK/NACK.

## 16.5.3.2 RRC-based active BWP switch for RedCap

### 16.5.3.2.0 Minimum conformance requirements

#### 16.5.3.2.0.1 Minimum conformance requirements for RRC-based active BWP switch for RedCap

For RRC-based BWP switch, after the UE receives *RRCreconfiguration* involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessing\,Delay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessing\,Delay}$ is the length of the RRC procedure delay in ms as defined in clause 11.2 in TS 36.331 [29] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [13], and

$T_{BWPswitchDelayRRC} = 6\ ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP switch occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [8].

The normative reference for this requirement is TS 38.133 [6] clause 8.6A.3.

During T1, the UE shall be ready for the reception of uplink grant for the Cell from the first DL slot that occurs right after the beginning of slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$ and starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$ + k1.

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in TS 38.321 [12].

All of the above test requirements shall be fulfilled in order for the observed Cell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

## 16.5.4 UE specific CBW change for RedCap

### 16.5.4.0 Minimum conformance requirements

#### 16.5.4.0.1 Minimum conformance requirements for UE specific CBW change

The requirements in this clause apply for a RedCap UE receives reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

After the UE receives *RRCreconfiguration* involving *offsetToCarrier* or *carrierBandwidth* change on the old CBW, UE shall be able to receive PDSCH/PDCCH on the DL BWP with BWP ID firstActiveDownlinkBWP-Id or transmit PUSCH on the UL BWP with BWP ID firstActiveUplinkBWP-Id of the new CBW right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

- DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and
- $T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in millisecond as defined in TS 36.331 [29] clause 11.2 is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in millisecond as defined in TS 38.331 [13] clause 12, and
- $T_{CBWchangeDelayRRC} = 6\,ms$ is the time used by the UE to perform CBW change.

The UE is not required to transmit UL signals or receive DL signals during the above defined time duration $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ on the cell where UE-specific CBW change occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [8].

The normative reference for this requirement is TS 38.133 [6] clauses 8.13A.1 and 8.13A.2.

# 16.6 Measurement procedures for RedCap

## 16.6.1 Intra-frequency measurements for RedCap

### 16.6.1.0 Minimum conformance requirements

#### 16.6.1.0.1 General

A measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the reference SSB of the serving cell and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same. The reference SSB is the SSB defined in BWP-specific *servingCellMO* under *BWP-DownlinkDedicated* of active DL BWP. If the field is absent, the reference SSB is the SSB defined in *servingCellMO* under *ServingCellConfig*.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP as specified in TS 38.213 [8].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in TS 38.133 [6] clause 9.2B.5.3.

SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range 1.

The requirements in this clause apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap:
  - SS-RSRP related side conditions given in TS 38.133 [6] clauses 10.1A.2 and 10.1A.3 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in TS 38.133 [6] clauses 10.1A.6 and 10.1A.7 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in TS 38.133 [6] clauses 10.1A.10 and 10.1A.11 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.7 for a corresponding band.
- For 1 Rx RedCap:
  - SS-RSRP related side conditions given in clauses TS 38.133 [6] clauses 10.1A.2 and 10.1A.3 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in clauses TS 38.133 [6] clauses 10.1A.6 and 10.1A.7 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in clauses TS 38.133 [6] clauses 10.1A.10 and 10.1A.11 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.7 for a corresponding band.

For 2 Rx RedCap: The requirements in TS 38.133 [6] clause 9.2B.4.3 shall apply.

For 1 Rx RedCap: Reported RSRP, RSRQ, and RS-SINR measurements contained in event triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.1A.2.1 (RSRP for FR1), 10.1A.6.1 (RSRQ for FR1), 10.1A.10.1 (RS-SINR for FR1).

The UE shall not send any event triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ with\ index_RedCap}$ or $T_{identify\ intra\ without\ index_RedCap}$ defined in clause 16.6.1.0.2 or clause 16.6.1.0.3. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index_RedCap}$ or $T_{identify_intra_with_index_RedCap}$ as defined in clause 16.6.1.0.2 or clause 16.6.1.0.3. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index_RedCap}$ or $T_{identify\ intra\ with\ index_RedCap}$ defined in clause 16.6.1.0.2 or clause 16.6.1.0.3 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ $T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [7]. When L3 filtering is used, an additional delay can be expected.

The normative reference for this requirement is TS 38.133 [6] clauses 9.2B.1 and 9.2B.4.3.

### 16.6.1.0.2 Minimum conformance requirements for event-triggered measurement without gap

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the

serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise, UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index_RedCap}$. The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap}$. It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD.

$$T_{identify_intra_without_index_RedCap} = (T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap})\ ms$$

$$T_{identify_intra_with_index_RedCap} = (T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap} + T_{SSB_time_index_intra_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in Table 16.6.1.0.2-1 for 2 Rx RedCap and Table 16.6.1.0.2-2 for 1 Rx RedCap.

$T_{SSB_time_index_intra_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in Table 16.6.1.0.2-3 for 2 Rx RedCap and Table 16.6.1.0.2-4 for 1 Rx RedCap.

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in Table 16.6.1.0.2-5 for 2 Rx RedCap and Table 16.6.1.0.2-6 for 1 Rx RedCap.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps.

When intra-frequency SMTC is fully non overlapping with measurement gaps, Kp=1.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

If the high layer in TS 38.331 [13] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*. Otherwise, SMTC periodicity follows *smtc1*.

### 16.6.1.1.4.2 Test procedure

The test consists of two successive time periods with time duration of T1 and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

2. Set the parameters according to T1 in Table 16.6.1.1.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message to configure Event A3 triggered reporting and dedicated BWP-1, which contains NCD-SSB configuration, as specified in clause 16.6.1.1.4.3. RedCap-specific dedicated BWP-1 is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value and aligned with channel raster) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where,

- $f_{\mathrm{CDSSB}}$ is the absolute frequency of CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;

- $f_{\mathrm{pointA}}$ is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta \mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-1 [2] clause 5.4.2.1;
- $\mathrm{SCS}_{\mathrm{SSB}}$ is the subcarrier spacing of SSB (in kHz);
- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

5. The UE shall transmit an *RRCReconfigurationComplete* message. T1 starts upon the SS receives the *RRCReconfigurationComplete* message.
6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.6.1.1.5-1. T2 starts. The SS also transmits NCD-SSB on Cell 2 with an absolute frequency of $f_{\mathrm{NCDSSB}}$ calculated above.
7. The SS increases the number of successful tests by one if the UE transmits a *MeasurementReport* message triggered by event A3 satisfying the overall delay requirement specified in clause 16.6.1.1.5, otherwise the SS increases the number of failure tests by one.
8. After the SS receive the *MeasurementReport* message in step 7) or when T2 expires, the SS shall:
   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.
9. Depending on the choice in step 8, the SS shall,
   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 8. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 8.
10. Repeat steps 1-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

They are not settable parameters themselves. | | | | | | |

The overall delay is measured from the beginning of time period T2 to the time that the SS receives the first *MeasurementReport* message triggered by event A3. It is allowed to be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delay specified in TS 38.133 [6] clause 9.2B.4 due to the TTI insertion uncertainty of the measurement report in DCCH.

Then the overall delay shall be no larger than: $T_{identify_intra_without_index}$ + 2 x $TTI_{DCCH}$, where

- $T_{identify_intra_without_index}$ = 1000 ms, is the time for intra-frequency cell identification specified in TS 38.133 [6] clause 9.2B.5.1,
- $TTI_{DCCH}$ = 1 ms.

Which gives a total of 1002 ms.

The UE is not required to read the neighbour cell SSB index in this test.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

## 16.6.1.2 NR SA FR1 Event triggered reporting tests without gap under non-DRX for 2 Rx UE

### 16.6.1.2.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in TS 38.133 [6] clauses 9.2B.5.1 and 9.2B.5.2.

### 16.6.1.2.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

### 16.6.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 16.6.1.0.1 and 16.6.1.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.16.6.1.2.

### 16.6.1.2.4 Test description

Two cells are deployed in the test, which are FR1 PCell (NR Cell 1) and a FR1 neighbour cell (NR Cell 2) on the same frequency as the PCell. The general and cell specific test parameters for PCell and neighbour cell are given in Table 16.6.1.2.4.1-3 and Table 16.6.1.2.5-1, respectively. In the measurement configuration a measurement object is configured for the frequency of the PCell, and it indicates to the UE that event-triggered reporting with Event A3 is used.

8. After the SS receive the *MeasurementReport* message in step 7) or when T2 expires, the SS shall:

   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.

9. Depending on the choice in step 8, the SS shall,

   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 8. If the paging fails, switches off and on the UE,

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The overall delay is measured from the beginning of time period T2 to the time that the SS receives the first *MeasurementReport* message triggered by event A3. It is allowed to be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delay specified in TS 38.133 [6] clause 9.2B.4 due to the TTI insertion uncertainty of the measurement report in DCCH.

Then the overall delay shall be no larger than: $T_{identify_intra_without_index}$ + 2 x $TTI_{DCCH}$, where

- $T_{identify_intra_without_index}$ = 1000 ms, is the time for intra-frequency cell identification specified in TS 38.133 [6] clause 9.2B.5.1,
- $TTI_{DCCH}$ = 1 ms.

Which gives a total of 1002 ms.

The UE is not required to read the neighbour cell SSB index in this test.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

- Step 6 in clause 6.6.1.2.4.2 is replaced by following step.

6. UE shall transmit a *MeasurementReport* message triggered by Event A3. If the overall delays measured from the beginning of time period T2 is less than 922 ms for Test 1 or less than 7682 ms for Test 2 then the number of successful tests is increased by one. If the UE fails to report the event within the overall delays measured requirement then the number of failure tests is increased by one.

- Table 6.6.1.2.5-1 is replaced by Table 16.6.1.3.5-1.
- The overall delay measured is expressed as:

  Overall delays measured = $T_{PSS/SSS_sync_intra_RedCap}$ + $T_{SSB_measurement_period_intra_RedCap}$ + TTI insertion uncertainty

  - $T_{PSS/SSS_sync_intra_RedCap}$ = 600 ms for Test 1, and $T_{PSS/SSS_sync_intra_RedCap}$ = 4480 ms for Test 2;
  - $T_{SSB_measurement_period_intra_RedCap}$= 320 ms for Test 1, and $T_{PSS/SSS_sync_intra_RedCap}$ = 3200 ms for Test 2
  - TTI insertion uncertainty = 2 ms

  As a result, the overall delay measured for Test 1 and Test 2 shall be less than a total of 922 ms and 7682 ms respectively.

- The overall delay measured is expressed as:

  Overall delays measured = $T_{PSS/SSS_sync_intra_RedCap}$ + $T_{SSB_measurement_period_intra_RedCap}$ + TTI insertion uncertainty

  - $T_{PSS/SSS_sync_intra_RedCap}$ = 600 ms for Test 1, and $T_{PSS/SSS_sync_intra_RedCap}$ = 4480 ms for Test 2;

| Note 1: NCD-SSB is configured within dedicated RedCap DL BWP. | | | |

### 16.6.1.9.4.2 Test procedure

The test consists of two successive time periods with time duration of T1 and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

2. Set the parameters according to T1 in Table 16.6.1.9.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message to configure Event A3 triggered reporting and dedicated BWP-1, which contains NCD-SSB configuration, as specified in clause 16.6.1.9.4.3. RedCap-specific dedicated BWP-

1 is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value and aligned with channel raster) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where,

- $f_{\mathrm{CDSSB}}$ is the absolute frequency of CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $f_{\mathrm{pointA}}$ is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta\mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-1 [2] clause 5.4.2.1;
- $\mathrm{SCS}_{\mathrm{SSB}}$ is the subcarrier spacing of SSB (in kHz);
- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

5. The UE shall transmit an *RRCReconfigurationComplete* message. T1 starts upon the SS receives the *RRCReconfigurationComplete* message.
6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.6.1.9.5-1. T2 starts. The SS also transmits NCD-SSB on Cell 2 with an absolute frequency of $f_{\mathrm{NCDSSB}}$ calculated above.
7. The SS increases the number of successful tests by one if the UE transmits a *MeasurementReport* message triggered by event A3 satisfying the overall delay requirement specified in clause 16.6.1.9.5, otherwise the SS increases the number of failure tests by one.
8. After the SS receive the *MeasurementReport* message in step 7) or when T2 expires, the SS shall:
   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.
9. Depending on the choice in step 8, the SS shall,
   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 8. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 8.
10. Repeat steps 1-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

| Note 4: | The starting PRB index for dedicated DL BWP1 corresponding to CD-SSB PRB index; the starting PRB index for dedicated DL BWP2 corresponding to NCD-SSB PRB index. |

The overall delay is measured from the beginning of time period T2 to the time that the SS receives the first *MeasurementReport* message triggered by event A3. It is allowed to be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delay specified in TS 38.133[6] clause 9.2B.4 due to the TTI insertion uncertainty of the measurement report in DCCH.

Then the overall delay shall be no larger than: $T_{identify_intra_with_index}$ + 2 x $TTI_{DCCH}$, where

- $T_{identify_intra_with_index}$ = 1480 ms, is the time for intra-frequency cell identification specified in TS 38.133 [6] clause 9.2B.5.1,
- $TTI_{DCCH}$ = 1 ms.

Which gives a total of 1482 ms.

The UE is required to read the neighbour cell SSB index and report the acquired SSB index in this test.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

## 16.6.1.10 NR SA FR1 Event triggered reporting tests without gap under non-DRX with SSB index reading for 2 Rx UE

### 16.6.1.10.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in TS 38.133 [6] clauses 9.2B.5.1 and 9.2B.5.2.

### 16.6.1.10.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

### 16.6.1.10.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 16.6.1.0.1 and 16.6.1.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.16.6.1.10.

### 16.6.1.10.4 Test description

Two cells are deployed in the test, which are FR1 PCell (NR Cell 1) and a FR1 neighbour cell (NR Cell 2) on the same frequency as the PCell. The general and cell specific test parameters for FDD PCell and neighbour cell are given in Table 16.6.1.10.4.1-3 and Table 16.6.1.10.5-1, respectively. In the measurement configuration a measurement object is configured for the frequency of the PCell, and it indicates to the UE that event-triggered reporting with Event A3 is used.

### 16.6.1.10.4.2 Test procedure

The test consists of two successive time periods with time duration of T1 and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

2. Set the parameters according to T1 in Table 16.6.1.10.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message to configure Event A3 triggered reporting and dedicated BWP-1, which contains NCD-SSB configuration, as specified in clause 16.6.1.10.4.3. RedCap-specific dedicated BWP-1 is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value and aligned with channel raster) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where,

- $f_{\mathrm{CDSSB}}$ is the absolute frequency of CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $f_{\mathrm{pointA}}$ is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta\mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-1 [2] clause 5.4.2.1;
- $\mathrm{SCS}_{\mathrm{SSB}}$ is the subcarrier spacing of SSB (in kHz);
- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

5. The UE shall transmit an *RRCReconfigurationComplete* message. T1 starts upon the SS receives the *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 16.6.1.10.5-1. T2 starts. The SS also transmits NCD-SSB on Cell 2 with an absolute frequency of $f_{\mathrm{NCDSSB}}$ calculated above.

7. The SS increases the number of successful tests by one if the UE transmits a *MeasurementReport* message triggered by event A3 satisfying the overall delay requirement specified in clause 16.6.1.10.5, otherwise the SS increases the number of failure tests by one.

8. After the SS receive the *MeasurementReport* message in step 7) or when T2 expires, the SS shall:

   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.

9. Depending on the choice in step 8, the SS shall,

   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 8. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 8.

10. Repeat steps 1-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

The overall delay is measured from the beginning of time period T2 to the time that the SS receives the first *MeasurementReport* message triggered by event A3. It is allowed to be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delay specified in TS 38.133 [6] clause 9.2B.4 due to the TTI insertion uncertainty of the measurement report in DCCH.

Then the overall delay shall be no larger than: $T_{identify_intra_with_index}$ + 2 x $TTI_{DCCH}$, where

- $T_{identify_intra_with_index}$ = 1240 ms, is the time for intra-frequency cell identification specified in TS 38.133 [6] clause 9.2B.5.1,
- $TTI_{DCCH}$ = 1 ms.

Which gives a total of 1242 ms.

The UE is required to read the neighbour cell SSB index and report the acquired SSB index in this test.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

## 16.6.2 Inter-frequency measurements for RedCap

### 16.6.2.0 Minimum conformance requirements

#### 16.6.2.0.1 Minimum conformance requirements for inter-frequency event-triggered measurement with measurement gaps

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise, UE shall be able to identify a new detectable inter-

frequency cell within $T_{identify_inter_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index_RedCap}$.

$$T_{identify_inter_without_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap}) \text{ ms}$$

$$T_{identify_inter_with_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap} + T_{SSB_time_index_inter_RedCap}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_inter_RedCap}$: it is the time period used in PSS/SSS detection given in Table 16.6.2.0.1-1 and Table 16.6.2.0.1-2.

$T_{SSB_time_index_inter_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in Table 16.6.2.0.1-3 and Table 16.6.2.0.1-4.

$T_{SSB_measurement_period_inter_RedCap}$: equal to a measurement period of SSB based measurement given in Table 16.6.2.0.1-5 and Table 16.6.2.0.1-6.

Editor's note: which power class to be used for RedCap depends on the RF session outcome.

$CSSF_{inter_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps.

| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 in TS 38.133 [6]. | |

When measurement gaps are provided for inter-frequency measurements, the RedCap UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as

specified in TS 38.133 [6] clauses 10.1A.4, 10.1A.5, 10.1A.8, 10.1A.9, 10.1A.12 and 10.1A.13, respectively, as shown in table 16.6.2.0.1-5 for 2 Rx RedCap and in table 16.6.2.0.1-6 for 1 Rx RedCap, respectively.

| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 in TS 38.133 [6]. | |

| DRX cycle > 320 ms | $8 \times DRX\ cycle \times CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 in TS 38.133 [6]. | |

For 2 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

For 1 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.1A.4.1, 10.1A.8.1 and 10.1A.12.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. Both $T_{identify_inter_without_index_RedCap}$ and $T_{identify_inter_with_index_RedCap}$ are defined in TS 38.133 [6] in clause 9.3B.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index_RedCap}$ or $T_{identify_intra_with_index_RedCap}$ as defined in TS 38.133 [6] in clause 9.2B.5.1 or clause 9.2B.6.2. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index_RedCap}$ or $T_{identify\ intra\ with\ index_RedCap}$ defined in TS 38.133 [6] in clause 9.2B.5.1 or clause 9.2B.6.2 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}\ T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [7]. When L3 filtering is used, an additional delay can be expected.

### 16.6.2.0.2 Minimum conformance requirements for inter-frequency event-triggered measurements without measurement gaps

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index_RedCap}$. It is assumed that when UE performs inter-frequency measurements without measurement gaps in a TDD bands on FR1 and FR2, the following conditions are met:

- SFN and frame boundary across serving cell and inter-frequency neighbor cells is aligned, and
- the timing of SSBs across serving cell and inter-frequency neighbor cells are aligned

$$T_{identify_inter_without_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap}) \text{ ms}$$

$$T_{identify_inter_with_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap} + T_{SSB_time_index_inter_RedCap}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_inter_RedCap}$: it is the time period used in PSS/SSS detection given in table 16.6.2.0.2-1, table 16.6.2.0.2-2.

$T_{SSB_time_index_inter_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in table 16.6.2.0.2-3 and table 16.6.2.0.2-4.

$T_{SSB_measurement_period_inter_RedCap}$: equal to a measurement period of SSB based measurement given in table 16.6.2.0.2-5, table 16.6.2.0.2-6.

$CSSF_{inter_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when inter-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps or according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps, i.e. when inter-frequency SMTC is fully overlapping with measurement gaps.

$M_{pss/sss_sync_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_inter_RedCap}$ = 40 samples. For a UE supporting FR2 power class 2, $M_{pss/sss_sync_inter_RedCap}$ = 24 samples. For a UE supporting FR2 power class 3, $M_{pss/sss_sync_inter_RedCap}$ = 24 samples. For a UE supporting FR2 power class 4, $M_{pss/sss_sync_RedCap}$ = 24 samples. For a UE supporting FR2 power class 7, $M_{pss/sss_sync_inter_RedCap}$ = 24 samples.

$M_{SSB_index_inter_RedCap}$: For a UE supporting power class 1 or 5, $M_{SSB_index_inter_RedCap}$ = 40 samples. For a vehicle mounted UE supporting power class 2, $M_{pss/sss_sync_inter_RedCap}$ = 24 samples. For a UE supporting power class 3, $M_{SSB_index_inter_RedCap}$ = 24 samples. For a UE supporting power class 4, $M_{meas_period_inter_RedCap}$ = 24 samples. For a UE supporting power class 7, $M_{SSB_index_inter_RedCap}$ = 24 samples.

$M_{meas_period_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter_RedCap}$ = 40 samples. For a vehicle mounted UE supporting FR2 power class 2, $M_{pss/sss_sync_inter_RedCap}$ = 24 samples. For a UE supporting FR2 power class 3, $M_{meas_period_inter_RedCap}$ = 24 samples. For a UE supporting FR2 power class 4, $M_{meas_period_inter_RedCap}$ = 24 samples. For a UE supporting FR2 power class 7, $M_{meas_period_inter_RedCap}$ = 24 samples.

When inter-frequency SMTC is fully non overlapping with measurement gaps or inter-frequency SMTC is fully overlapping with MGs, Kp = 1.

When inter-frequency SMTC is partially overlapping with measurement gaps, Kp = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP.

For FR2,

$K_{layer1_measurement}$ = 1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by inter-frequency SMTC occasions, or

- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by inter-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by *SSB-ToMeasure* and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$ = 1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: SSB_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1080 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 11520 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test 1 and 2 UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: SSB_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1080 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 10240 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test 1 and 2 UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## 16.6.2.3 NR SA FR1-FR1 Event triggered reporting tests for FR1 without SSB time index detection when DRX is not used for 1 Rx UE

### 16.6.2.3.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the inter-frequency cell search requirements in TS 38.133 [6] clause 9.3B.4.

### 16.6.2.3.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

### 16.6.2.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.6.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.16.6.2.3.

#### 16.6.2.3.4 Test description

Two cells are deployed in the test, which are FR1 PCell (NR Cell 1) and a FR1 neighbour cell (NR Cell 2) on the different frequency as the PCell. The general and cell specific test parameters for PCell and neighbour cell are given in Table 16.6.2.3.4.1-3 and Table 16.6.2.3.5-1, respectively. In the measurement configuration a measurement object is configured for the frequency of the neighbour cell, and it indicates to the UE that event-triggered reporting with Event A3 is used.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with a confidence level of 95%.

The UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

In test 1 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1440 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test 2 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 15360 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test 1 and 2 the UE is required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### 16.6.2.8.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

### 16.6.2.8.4 Test description

Two cells are deployed in the test, which are FR1 PCell (NR Cell 1) and a FR1 neighbour cell (NR Cell 2) on the different frequency as the PCell. The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1440 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

In test config 1 and 4, UE is required to report SSB time index. The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1280 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

In test config 2 and 3, UE is not required to report SSB time index. The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

NOTE: The actual overall delays measured in the test is 2 ms higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## 16.6.2.12 NR SA FR1-FR1 Event triggered reporting tests for FR1 when DRX is used for 2 Rx UE

### 16.6.2.12.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the inter-frequency NR cell search without measurement gap requirements in TS 38.133 [6] clause 9.3B.7.

### 16.6.2.12.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx which supports *interFrequencyMeas-Nogap-r16* from Release 17 onwards and long DRX cycle.

### 16.6.2.12.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.6.2.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.6.2.12.

### 16.6.2.12.4 Test description

Two cells are deployed in the test, which are FR1 PCell (NR Cell 1) and a FR1 neighbour cell (NR Cell 2) on the different frequency as the PCell. The general and cell specific test parameters for PCell and neighbour cell are given in Table 16.6.2.12.4.1-3 and Table 16.6.2.12.5-1, respectively. In the measurement configuration a measurement object is configured for the frequency of the neighbour cell, and it indicates to the UE that event-triggered reporting with Event A3 is used.

## 16.6.3 Inter-RAT measurements for RedCap

### 16.6.3.0 Minimum conformance requirements

#### 16.6.3.0.1 Minimum conformance requirements for inter-RAT event triggered reporting to E-UTRAN FDD

The requirements are applicable for NR−E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN FDD cell is considered to be detectable when:

- For 2 Rx RedCap UE:

- RSRP related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],
- RSRQ related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],
- RS-SINR related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [23].

- For 1 Rx RedCap UE:
  - RSRP related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2A.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],
  - RSRQ related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2A.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],

#### 16.6.3.0.1.1 Requirements when no DRX is used

When the UE requires measurement gaps to identify and measure inter-RAT cells and an appropriate measurement gap pattern is scheduled, the UE shall be able to identify a new detectable FDD cell within $T_{\text{Identify_RedCap, E-UTRAN FDD}}$ according to the following expression:

$$T_{\text{Identify_RedCap,E-UTRAN FDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1_RedCap}}} \cdot \text{CSSF}_{\text{interRAT_RedCap}} \quad ms,$$

where:

$T_{\text{BasicIdentify}}$ = 480 ms,

$T_{\text{Inter1_RedCap}}$ is defined in TS 38.133 [6] clause 9.4A.1,

$\text{CSSF}_{\text{interRAT_RedCap}} = \text{CSSF}_{\text{within_gap_RedCap,i}}$ is the scaling factor for the measured inter-RAT E-UTRA carrier *i* which is calculated as specified in TS 38.133 [6] clause 9.1A.5.2.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{\text{Measure_RedCap, E-UTRAN FDD}}$ defined in Table 16.6.3.0.1.1-1 and Table 16.6.3.0.1.1-2 for 2 Rx RedCap UE and 1 Rx RedCap UE, respectively.

**Table 16.6.3.0.1.1-1: Measurement period and measurement bandwidth for 2 Rx RedCap UE**

| Configuration | Physical Layer Measurement period: $T_{\text{Measure_RedCap, E-UTRAN FDD}}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 480 x $\text{CSSF}_{\text{interRAT_RedCap}}$ | 6 |
| 1 (Note 1) | 240 x $\text{CSSF}_{\text{interRAT_RedCap}}$ | 50 |
| NOTE 1: This configuration is optional. | | |

**Table 16.6.3.0.1.1-2: Measurement period and measurement bandwidth for 1 Rx RedCap UE**

| Configuration | Physical Layer Measurement period: $T_{\text{Measure_RedCap, E-UTRAN FDD}}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 960 x $\text{CSSF}_{\text{interRAT_RedCap}}$ | 6 |
| 1 (Note 1) | 480 x $\text{CSSF}_{\text{interRAT_RedCap}}$ | 50 |
| NOTE 1: This configuration is optional. | | |

The UE shall be capable of identifying and performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD carrier frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers.

If higher layer filtering is used, an additional cell identification delay can be expected.

For 2 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2.3. The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2.5.

For 1 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2A.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2A.3.

#### 16.6.3.0.1.2 Requirements when DRX is used

If higher layer filtering is used, an additional cell identification delay can be expected.

For 2 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3. The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2.5.

For 1 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2A.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in TS 38.133 [6] clause 10.2A.3.

#### 16.6.3.0.1.3 Measurement reporting requirements for Event-Triggered Reporting

For 2 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

For 1 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP and RSRQ measurements contained in event-triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.2A.2 and 10.2A.3, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ defined in clauses 16.6.3.0.1.1 and 16.6.3.0.1.2 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [13], the event triggered measurement reporting delay shall be less than $T_{Measure_RedCap,\ E\text{-}UTRAN\ FDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap has not been available and the L3 filter has not been used.

### 16.6.3.0.2 Minimum conformance requirements for inter-RAT event triggered reporting to E-UTRAN TDD

The requirements are applicable for NR−E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN TDD cell is considered to be detectable when:

- For 2 Rx RedCap UE:
  - RSRP related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],
  - RSRQ related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],

    RS-SINR related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [23].
- For 1 Rx RedCap UE:

- RSRP related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2A.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],

- RSRQ related conditions in the accuracy requirements in TS 38.133 [6] clause 10.2A.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [23],

#### 16.6.3.0.2.1 Requirements when no DRX is used

When the UE requires measurement gaps to identify and measure inter-RAT cells and an appropriate measurement gap pattern is scheduled, the UE shall be able to identify a new detectable TDD cell within $T_{\text{Identify_RedCap, E-UTRAN TDD}}$ according to the following expression:

- When configuration 0 or configuration 1 in Table 16.6.3.0.2.1-1 is applied,

$$T_{\text{Identify_RedCap,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1_RedCap}}} \cdot \text{CSSF}_{\text{interRAT_RedCap}} \quad ms,$$

- When configuration 2 or configuration 3 in Table 16.6.3.0.2.1-1 is applied,

$$T_{\text{Identify_RedCap,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1_RedCap}}} \cdot \text{CSSF}_{\text{interRAT_RedCap}} + 240 \cdot \text{CSSF}_{\text{interRAT_RedCap}} \quad ms,$$

where:

$T_{\text{BasicIdentify}}$ = 480 ms,

$T_{\text{Inter1_RedCap}}$ is defined in TS 38.133 [6] clause 9.4A.1,

$\text{CSSF}_{\text{interRAT_RedCap}} = \text{CSSF}_{\text{within_gap_RedCap,i}}$ is the scaling factor for the measured inter-RAT E-UTRA carrier *i* which is calculated as specified in TS 38.133 [6] clause 9.1A.5.2.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{\text{Measure_RedCap, E-UTRAN TDD}}$ defined in Table 16.6.3.0.2.1-1 and Table 16.6.3.0.2.1-2 for 2 Rx RedCap UE and 1 Rx RedCap UE, respectively.

### 16.6.3.0.2.3 Measurement reporting requirements for Event-Triggered Reporting

For 2 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

For 1 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP and RSRQ measurements contained in event-triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.2A.2 and 10.2A.3, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify_RedCap,\ E\text{-}UTRAN\ TDD}$ defined in clauses 16.6.3.0.2.1 and 16.6.3.0.2.2 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify_RedCap,\ E\text{-}UTRAN\ TDD}$ becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [13], the event

triggered measurement reporting delay shall be less than $T_{Measure_RedCap,\ E\text{-}UTRAN\ TDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap has not been available and the L3 filter has not been used.

Note 1: Special subframe and uplink-downlink configurations are specified in table 4.2-1 in TS 36.211 [24].
Note 2: DL RMCs and OCNG patterns are specified in clauses A 3.1 and A 3.2 of TS 36.133 [23] respectively.
Note 3: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 5: $\hat{E}_s/I_{ot}$, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 3840 ms from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

The UE shall not send event-triggered measurement reports as long as the reporting criteria is not fulfilled.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

NOTE: The actual overall delays measured in the test may be up to 2 ms higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## 16.6.3.2 NR - E-UTRA event-triggered reporting in non-DRX for 2 Rx UE

### 16.6.3.2.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the NR - E-UTRAN inter-RAT cell search requirements in TS 38.133 [6] clauses 9.4A.2 and 9.4A.3.

### 16.6.3.2.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

### 16.6.3.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 16.6.3.0.1 and 16.6.3.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.6.3.2.

### 16.6.3.2.4 Test description

Two cells are deployed in the test, Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. The general and cell specific test parameters for PCell and neighbour cell are given in Table 16.6.3.2.4.1-3, Table

16.6.3.2.5-1 and Table 16.6.3.2.5-2, respectively. In the measurement configuration a measurement object is configured for the frequency of the PCell, and it indicates to the UE that event-triggered reporting with Event B2 (PCell becomes worse than threshold1 and inter-RAT neighbour becomes better than *threshold2*) is used. The test consists of two consecutive time periods, with durations T1 and T2, respectively. Prior to the start of time duration T1, the UE shall be fully synchronized to Cell 1. During T1, the UE shall not have any information on Cell 2.

#### 16.6.3.2.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 16.6.3.2.4.1-1.

In test 1, the UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 3840 ms from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

In test 2, the UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 12800 ms from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

The UE shall not send event-triggered measurement reports as long as the reporting criteria is not fulfilled.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

NOTE: The actual overall delays measured in the test may be up to 2 ms higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## 16.6.4 L1-RSRP measurement for beam reporting for RedCap

### 16.6.4.0 Minimum conformance requirements

#### 16.6.4.0.1 General

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP. The measurements shall be performed for PCell, on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to TS 38.133 [6] clause 10.1A.14 for FR1, for 1 Rx RedCap, and TS 38.133 [6] clause 10.1.19 for FR1 and TS 38.133 [6] clause 10.1.20 for FR2 for 2 Rx RedCap, if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in TS 38.133 [6] clause 10.1A.14 for FR1, for 1 Rx RedCap, and TS 38.133 [6] clause 10.1.19 for FR1 and TS 38.133 [6] clause 10.1.20 for FR2 for 2 Rx RedCap. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in TS 38.133 [6] clause 10.1.6.

For 1 Rx RedCap, reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in TS 38.133 [6] clause 10.1A.14 for FR1.

For 2 Rx RedCap, reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [9].

For 1 Rx RedCap, reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in TS 38.133 [6] clause 10.1A.14.

For 2 Rx Redcap, reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [9].

For FD-FDD and TDD RedCap UEs, there are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

For HD-FDD RedCap UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during the CBD evaluation period, as CBD evaluation is prioritized over UL transmission. The CBD evaluation period equals the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ in case L1-RSRP measurement is performed on SSB as defined in clause 16.6.4.0.2, or $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ in case L1-RSRP measurement is performed on CSI-RS and/or SSB as defined in clause 16.6.4.0.3.

For UEs which support *simultaneousRxDataSSB-DiffNumerology* defined in TS 38.331 [13] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* defined in TS 38.331 [13] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- For FD-FDD and TDD RedCap UEs, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

- For HD-FDD RedCap UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during the CBD evaluation period, as CBD evaluation is prioritized over UL transmission. The CBD evaluation period equals the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ in case L1-RSRP measurement is performed on SSB as defined in clause 16.6.4.0.2, or $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ in case L1-RSRP measurement is performed on CSI-RS and/or SSB as defined in clause 16.6.4.0.3.

The normative reference for this requirement is TS 38.133 [6] clauses 9.5B.1, 9.5B.3 and 9.5B.6.

#### 16.6.4.0.2 Minimum conformance requirements for SSB based L1-RSRP measurement for beam reporting

The requirements in this clause apply, provided:

- The SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

For 1 Rx RedCap:

- L1-RSRP related side conditions given in TS 38.133 [6] clause 10.1A.14.1 for FR1, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to TS 38.133 [6] Annex B.2.4.1 for a corresponding band.

For 2 Rx RedCap:

- L1-RSRP related side conditions given in TS 38.133 [6] clauses 10.1.19.1 and 10.1.20.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to TS 38.133 [6] Annex B.2.4.1 for a corresponding band.

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ is defined in Table 16.6.4.0.2-1 for FR1 for 2 Rx RedCap, and Table 16.6.4.0.2-2 for FR1 for 1 Rx RedCap, where:

- M = 1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M = 3 otherwise.

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MRGP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

Where:

- $T_{SSB}$ = *ssb-periodicityServingCell*

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet pervious conditions.

For an FR1 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For an FR1 serving cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |

| Note: | $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. |
|---|---|

For FR1, when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

The normative reference for this requirement is TS 38.133 [6] clauses 9.5B.2, 9.5B.4.1 and 9.5B.5.1.

#### 16.6.4.0.3 Minimum conformance requirements for CSI-RS based L1-RSRP measurement for beam reporting

The requirements in this clause apply, provided:

- The CSI-RS resources configured for L1-RSRP measurements are measurable.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

For 1 Rx RedCap:

- L1-RSRP related side conditions given in TS 38.133 [6] clauses 10.1A.14.2 for FR1, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to TS 38.133 [6] Annex B.2.4.2 for a corresponding band.

For 2 Rx RedCap:

- L1-RSRP related side conditions given in TS 38.133 [6] clauses 10.1.19.2 and 10.1.20.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to TS 38.133 [6] Annex B.2.4.2 for a corresponding band.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ is defined in Table 16.6.4.0.3-1 for FR1 for 2 Rx RedCap, and in Table 16.6.4.0.3-2 for 1 Rx RedCap, where:

- For periodic CSI-RS resources, M = 1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M = 3 otherwise
- For aperiodic CSI-RS resources M = 1
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N = 1. The requirements apply if *qcl-InfoPeriodicCSI-RS* is configured for all the resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.

- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N = ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured with QCL-TypeD for all resources in the resource set.

- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N = 1. The requirements apply provided *qcl-info* is configured for all resources in the resource set and for each resource one RS has QCL-TypeD with

  - SSB for L1-RSRP measurement, or

  - another CSI-RS in resource set configured with repetition ON.

- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N = 1. UE is not required to meet the accuracy requirements in TS 38.133 [6] clauses 10.1.19.2 and 10.1.20.2 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requirements apply provided *qcl-info* is configured with QCL-TypeD for all resources in the resource set.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

Where:

$T_{CSI-RS}$ = the periodicity of CSI-RS configured for L1-RSRP measurement

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet pervious conditions.

For an FR1 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For an FR1 serving cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

| DRX cycle > 320 ms | ceil(M*P)*$T_{DRX}$ |
| Note 1: $T_{CSI-RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>Note 2: The requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

#### 16.6.4.1.4.2 Test procedure

Same as the test procedure given in clause 6.6.4.1.4.2 with following exceptions:

- Step 5 in test procedure given in clause 6.6.4.1.4.2 is replaced by following step.

5. The UE shall start sending valid L1-RSRP reports. The SS shall check following requirements:

   - R1: the UE shall start to transmit valid reports no later than 720 ms for configurations 1, 2, 4 and no later than 680 ms for configuration 3 from the beginning of time period T2. A valid report shall meet the absolute L1-RSRP requirement for SSB#1 (Table 16.6.4.1.5-2 for test configurations 1, 2, 4 and Table 16.6.4.1.5-3 for test configuration 3) and the relative L1-RSRP requirement for SSB#0 in Table 16.6.4.1.5-4. If the first valid report is received earlier than the specified time, the number of passed iterations for R1 is increased by one. Otherwise, the number of failed iterations for R1 is increased by one.

   - R2: the UE shall transmit reports every 80 slots until the end of time period T2. If the reports are received accordingly, the number of passed iterations for R2 is increased by one. Otherwise, the number of failed iterations for R2 is increased by one.

   - R3: The L1-RSRP value of SSB#1 reported by the UE is compared to the expected L1-RSRP value for SSB#1. In all consecutive reports after the first valid value is received, if the resulting value is outside the limits in Table 16.6.4.1.5-2 for test configurations 1, 2, 4 and in Table 16.6.4.1.5-3 for test configuration 3 or the UE fails to report the measurement value for SSB#1, the number of failed iterations for R3 is increased by one. Otherwise, the number of passed iterations for R3 is increased by one.

   -R4: The DIFF RSRP value of SSB#0 reported by the UE is compared to the expected DIFF RSRP value. In all consecutive reports after the first valid value is received, if the resulting value is outside the limits in Table 16.6.4.1.5-4 or the UE fails to report the measurement value for SSB#0, the number of failed iterations for R4 is increased by one. Otherwise, the number of passed iterations for R4 is increased by one.

### 16.6.4.3.4.2 Test procedure

Same as the test procedure given in clause 6.6.4.2.4.2 with following exceptions:

- Step 5 in test procedure given in clause 6.6.4.2.4.2 is replaced by following step.

5. The UE shall start sending valid L1-RSRP reports. The SS shall check following requirements:

   - R1: the UE shall start to transmit valid reports no later than 720 ms for configurations 1, 2, 4 and no later than 680 ms for configuration 3 from the beginning of time period T2. A valid report shall meet the absolute L1-RSRP requirement for SSB#1 (Table 16.6.4.3.5-2 for test configurations 1, 2, 4 and Table 16.6.4.3.5-3 for test configuration 3) and the relative L1-RSRP requirement for SSB#0 in Table 16.6.4.3.5-4. If the first valid report is received earlier than the specified time, the number of passed iterations for R1 is increased by one. Otherwise, the number of failed iterations for R1 is increased by one.

   - R2: the UE shall transmit reports every 80 slots until the end of time period T2. If the reports are received accordingly, the number of passed iterations for R2 is increased by one. Otherwise, the number of failed iterations for R2 is increased by one.

- R3: The L1-RSRP value of SSB#1 reported by the UE is compared to the expected L1-RSRP value for SSB#1. In all consecutive reports after the first valid value is received, if the resulting value is outside the limits in Table 16.6.4.3.5-2 for test configurations 1, 2, 4 and in Table 16.6.4.3.5-3 for test configuration 3 or the UE fails to report the measurement value for SSB#1, the number of failed iterations for R3 is increased by one. Otherwise, the number of passed iterations for R3 is increased by one.

-R4: The DIFF RSRP value of SSB#0 reported by the UE is compared to the expected DIFF RSRP value. In all consecutive reports after the first valid value is received, if the resulting value is outside the limits in Table 16.6.4.3.5-4 or the UE fails to report the measurement value for SSB#0, the number of failed iterations for R4 is increased by one. Otherwise, the number of passed iterations for R4 is increased by one.

## 16.6.5 NR measurements with autonomous gaps for RedCap

### 16.6.5.0 Minimum conformance requirements

#### 16.6.5.0.1 Minimum conformance requirements for NR SA FR1 intra-frequency CGI identification of NR neighbour cell in FR1 for 1 Rx UE

The requirements in this clause are specified for CGI identification of an NR target cell and are applicable for a UE in RRC_CONNECTED state and configured with SA operation mode.

The UE shall identify and report the CGI of a known NR target cell when requested by the network for the purpose of *reportCGI*. Only one cell is provided to the UE with *cellForWhichToReportCGI* for identifying the CGI. The UE may make autonomous gaps in both downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3 of TS 38.331 [13]. Note that a UE is not required to use autonomous gap if *useAutonomousGaps* is set to false. If autonomous gaps are used for measurement with the purpose of *reportCGI*, regardless of whether DRX is used or not, the UE shall be able to identify a new CGI of NR cell within:

$$T_{identify_CGI_redcap} = (T_{MIB_redcap} + T_{SIB1_redcap})\ ms$$

Where:

$T_{MIB_redcap}$ is the time period used to acquire MIB message. $T_{MIB_redcap} = 6 * T_{SMTC}$ ms for target cell carrier frequency on FR1.

$T_{SIB1_redcap}$ is the time period used to acquire SIB1 message. $T_{SIB1_redcap} = 12 * T_{RMSI\text{-}scheduling}$ ms.

Where $T_{SMTC}$ is the SMTC periodicity configured for the target cell measurement, and $T_{RMSI\text{-}scheduling}$ is

- the periodicity with which the SIB1 is actually transmitted by the NR target cell when SSB and RMSI CORESET multiplexing pattern is 1

- the maximum between the periodicity with which the SIB1 is actually transmitted by the NR target cell and $T_{SMTC}$ when SSB and RMSI CORESET multiplexing pattern is 2 or 3.

The requirement for identifying the CGI of an NR cell within $T_{identify_CGI_redcap}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [13] is used.

Within the time $T_{identify_CGI_redcap}$, over which the UE identifies the CGI of an NR cell, the UE shall fulfil interruption requirements specified in,

- Clause 9.11A.4 of TS 38.133 [6] if the UE is configured with SA operation mode.

In the requirement a cell is known if,

- During the last 5 seconds before the reception of the report CGI command:
  - The UE has sent a valid L3-RSRP measurement report with SSB index for the target cell and
- During MIB decoding at least reported SSBs remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133 [6], and
- During SIB1 decoding the SSB used for MIB decoding remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133 [6], and
- During MIB decoding, the SSB for MIB decoding remains detectable with SNR $\geqslant$ -3 dB
- During SIB1 decoding, the PDSCH for SIB1 decoding remains detectable with SNR $\geqslant$ -3 dB

The CGI reporting delay is defined as the time between a command that will trigger a CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI_redcap}$ plus RRC procedure delay defined in clause 12 in TS 38.331 [13].

When a RedCap UE is identifying CGI of an NR cell with autonomous gaps, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on PCell for the following slots:

- with up to K1 interruptions with interrupted slots up to X1 specified in Table 16.6.5.0.1-1 for each interruption during MIB decoding time period $T_{MIB_redcap}$ (ms).
- with up to L1 interruptions with interrupted slots up to Y1 specified in Table 16.6.5.0.1-1 during SIB1 decoding time period $T_{SIB1_redcap}$ (ms) for SSB and CORESET for RMSI scheduling multiplexing patterns 1.
- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in Table 16.6.5.0.1-1 during SIB1 decoding time period $T_{SIB1_redcap}$ (ms) for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 6 for the target cell carrier frequency on FR1, and
- L1 = $T_{SIB1_redcap}$ /20 and
- L2 = $T_{SIB1_redcap}$ /$T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 16.6.5.0.1-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |
| 2 | 0.25 | 24 | 25 | 19 |
| 3 | 0.125 | 48 | 49 | 37 |

The normative reference for this requirement is TS 38.133 [6] clause 9.11A.

### 16.6.5.0.2 Minimum conformance requirements for NR SA FR1 intra-frequency CGI identification of NR neighbour cell in FR1 for 2 Rx UE

Same as clause 16.6.5.0.1 with the following exception:

$$T_{SIB1_redcap} = 6 * T_{RMSI\text{-}scheduling} \text{ ms}$$

The normative reference for this requirement is TS 38.133 [6] clause 9.11A.

### 16.6.5.0.3 Minimum conformance requirements for CGI identification of an E-UTRA cell with autonomous gaps

The requirements in this clause apply when the 1 Rx RedCap UE or 2 Rx RedCap UE is configured with standalone NR. The UE shall identify and report the CGI when requested by an NR PCell for the purpose '*reportCGI*'. The UE may make autonomous gaps in downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3.1 in TS 38.331 [13].

For 2 Rx RedCap UE: If autonomous gaps are used for measurement with the purpose of '*reportCGI*', the UE shall be able to identify a new CGI of E-UTRA cell within$T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ = 150 ms.

For 1 Rx RedCap UE: If autonomous gaps are used for measurement with the purpose of '*reportCGI*', the UE shall be able to identify a new CGI of E-UTRA cell within $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ = 190 ms.

This is the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable following conditions are fulfilled:

- RSRP related side conditions given in Clause 9.1 in TS 36.133 [23] are fulfilled for a corresponding band,
- SCH_RP and SCH Ês/Iot according to Annex B.2.2 in TS 36.133 [23] for a corresponding band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to TS 36.101 [27].

The requirement for identifying a new CGI of an E-UTRA cell within $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [13] is used.

The E-UTRA CGI reporting delay is defined as the time between a command that will trigger an E-UTRA CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ plus RRC procedure delay defined in clause 12 in TS 38.331 [13], and an additional 30 ms margin.

When a UE is identifying CGI of an E-UTRA FDD cell or E-UTRA TDD cell with autonomous gaps, within time period $T_{identify_CGI_RedCap,\ E\text{-}UTRA}$ specified in this clause, the UE shall be able to transmit at least the number of ACK/NACKs specified in Table 16.6.5.0.3-1 on PCell in the frequency range where autonomous gaps are used, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,

- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured.

**Table 16.6.5.0.3-1: Minimum number of ACK/NACKs transmitted by the UE during $T_{identify_CGI_RedCap, E-UTRAN}$**

| Minimum number of transmitted ACK/NACKs | SCS | |

| | Duplex mode configuration | SCS |

| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [2]. | | |

### 16.6.5.1.4.2 Test procedure

The test consists of two cells: Cell 1 and Cell 2. Cell 1 is the FR1 PCell and Cell 2 is an FR1 neighbour cell on the same frequency as the PCell. The general and cell specific test parameters for PCell and neighbour cell are given in Table 16.6.5.1.4.1-3 and Table 16.6.5.1.5-1, respectively. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to T1 in Table 16.6.5.1.5-1. T1 starts.
3. Set Cell 2 physical cell identity = ((current Cell 2 physical cell identity + 3) mod 1008) for one iteration of the test procedure loop.
4. The SS shall switch the power setting from T1 to T2 as specified in Table 16.6.5.1.5-1. T2 starts.

5. SS shall transmit an *RRCReconfiguration* message to configure the measurement object for the frequency of the serving cell and to indicate the UE that event-triggered reporting with Event A3 is used.

6. The UE shall transmit *RRCReconfigurationComplete* message.

7. UE shall transmit a *MeasurementReport* message triggered by Event A3.

8. After the SS receives the *MeasurementReport* message in step 6, the SS shall transmit *RRCReconfiguration* message triggering CGI identification and configuring *reportCGI* and *useAutonomousGaps* IEs set to TRUE.

9. T3 starts when the last TTI containing the above RRC message implying CGI identification is sent to the UE.

10. The UE shall transmit *RRCReconfigurationComplete* message.

11. The SS verifies that potential interruption is carried out correctly by monitoring ACK/NACK sent in PCell during T3 until a measurement report with CGI is sent. If the UE sends a measurement report containing the CGI of Cell 2 within 372 ms from the start of time period T3, then the number of successful tests is increased by one otherwise the number of failure tests is increased by one.

12. Repeat steps 2-11 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

## 16.6.5.3 NR SA FR1 - E-UTRA CGI Identification of E-UTRA cell for 1 Rx UE

### 16.6.5.3.1 Test purpose

To verify the requirement for identification of a new CGI of E-UTRA cell with autonomous gaps in NR SA in TS 38.133 [6] clause 9.4A.4.

### 16.6.5.3.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards and supporting acquisition of CGI from neighbour E-UTRA cell using autonomous gap.

### 16.6.5.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.6.5.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.16.6.5.3.

### 16.6.5.3.4 Test description

The test scenario comprises of one NR carrier and an E-UTRA carrier and two cells. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would have ACK/NACK sending during identifying a new CGI of E-UTRAN cell.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively:

- At the start of time duration T1, the UE does not have any timing information of Cell 2.

- Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. A RRC message implying SI reading shall be sent to the UE during period T2, after the UE has reported Event B2. The RRC message shall create a measurement report configuration with purpose *reportCGI* and *useAutonomousGaps* set to *setup*.

- The start of T3 is the instant when the last TTI containing the RRC message implying SI reading is sent to the UE.

#### 16.6.5.3.4.2 Test procedure

Throughout the test, the UE shall be scheduled to perform DL reception on every slot suitable for DL.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell.
2. Set the parameters according to T1 in Table 16.6.5.3.5-1 and Table 16.6.5.3.5-2. T1 starts.
3. The SS transmits an *RRCReconfiguration* message to configure event B2 triggered measurement reporting on E-UTRA Cell 2.
4. The UE transmits an *RRCReconfigurationComplete* message.
5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Tables 16.6.5.3.5-1 and 16.6.5.3.5-2, T2 starts.
6. UE transmits a *MeasurementReport* message triggered by Event B2.
7. After receiving *MeasurementReport* message in step 6, the SS transmits an *RRCReconfiguration* message to release the gap configuration.
8. UE transmits an *RRCReconfigurationComplete* message.
9. After receiving *RRCReconfigurationComplete* message in step 6, the SS transmits an *RRCReconfiguration* message to configure an autonomous gap based CGI measurement reporting on E-UTRA Cell 2.
10. The start of T3 is the instant when the last TTI containing the *RRCReconfiguration* message in step 7 is sent to the UE, at that instant the SS shall switch the power setting from T2 to T3 as specified in Tables 16.6.5.3.5-1 and 16.6.5.3.5-2.
11. The UE transmits an *RRCReconfigurationComplete* message.
12. If the UE

    a) transmits a *MeasurementReport* message containing CGI of E-UTRA Cell 2 less than 240 ms from the beginning of time period T3, and

    b) transmits ACK/NACKs no less than the minimum number of ACK/NACKs given in Table 16.6.5.3.5-5 from the start of T3 until 240 ms,

    then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
13. Set Cell 2 physical cell identity = ((current Cell 2 physical cell identity + 1) mod 14 + 2) for next iteration of the test procedure loop.
14. Repeat steps 2-13 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: Special subframe and uplink-downlink configurations are specified in table 4.2-1 in TS 36.211 [24].
Note 2: DL RMCs and OCNG patterns are specified in clauses A 3.1 and A 3.2 of TS 36.133 [23] respectively.
Note 3: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 4: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 5: $\hat{E}_s/I_{ot}$, RSRP, and SCH_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall transmit a measurement report containing the cell global identifier of Cell 2 within overall delay from the start of T3, where the overall delay is calculated as follows,

Overall delay = $T_{RRC\ Processing}$ + $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ + additional margin + TTI insertion uncertainty

- $T_{RRC\ Processing}$ = 15 ms;
- $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ = 190 ms, is the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell;
- TTI insertion uncertainty = 2 x $TTI_{DCCH}$ = 2 ms, is the delay uncertainty when inserting the measurement report to the TTI of the uplink DCCH;
- additional margin = 30 ms, is specified in TS 38.133 [6] clause 9.4A.4.2

Which gives overall delay = 15 + 190 + 30 + 2 = 237 ms, allow 240 ms.

From the start of T3 until 240 ms. The number of ACK/NACK being transmitted by the UE shall be no less than the minimum number of ACK/NACK given in Table 16.6.5.3.5-5.

The rate of correct events observed during repeated tests shall be at least 90%.

**Table 16.6.5.3.5-5: Minimum number of ACK/NACKs transmitted by the UE during the overall delay**

| Test configuration | Minimum number of transmitted ACK/NACKs[Note 1] |
|---|---|
| 1, 4 | 127 |
| 2, 5 | 42 |
| 3, 6 | 115 |
| NOTE 1: The overall ACK/NACK number is caused by two parts. Firstly, at least X ACK/NACK shall be sent during identifying the cell global identifier of Cell 2, where X is defined in TS 38.133 [6] Table 9.4A.4.3-1. Secondly, given that continuous DL data allocation, additional 43, 14 and 34 ACK/NACK shall be sent for FDD 15 kHz, TDD 15 kHz and TDD 30 kHz, respectively, from the start of T3 until 240 ms excludes 190 ms for identifying the cell global identifier of Cell 2. | |

The UE shall transmit a measurement report containing the cell global identifier of Cell 2 within overall delay from the start of T3, where the overall delay is calculated as follows,

Overall delay = $T_{RRC\ Processing}$ + $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ + additional margin + TTI insertion uncertainty

- $T_{RRC\ Processing}$ = 15 ms;
- $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ = 150 ms, is the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell;

- TTI insertion uncertainty = 2 x $TTI_{DCCH}$ = 2 ms, is the delay uncertainty when inserting the measurement report to the TTI of the uplink DCCH;

- additional margin = 30 ms, is specified in TS 38.133 [6] clause 9.4A.4.2

Which gives overall delay = 15 + 150 + 30 + 2 = 197 ms, allow 200 ms.

From the start of T3 until 200 ms. The number of ACK/NACK being transmitted by the UE shall be no less than the minimum number of ACK/NACK given in Table 16.6.5.4.5-5.

The rate of correct events observed during repeated tests shall be at least 90%.

**Table 16.6.5.4.5-5: Minimum number of ACK/NACKs transmitted by the UE during the overall delay**

| Test configuration | Minimum number of transmitted ACK/NACKs Note 1 |
|---|---|
| 1, 4 | 127 |
| 2, 5 | 42 |
| 3, 6 | 115 |
| NOTE 1: The overall ACK/NACK number is caused by two parts. Firstly, at least X ACK/NACK shall be sent during identifying the cell global identifier of Cell 2, where X is defined in TS 38.133 [6] Table 9.4A.4.3-1. Secondly, given that continuous DL data allocation, additional 43, 14 and 34 ACK/NACK shall be sent for FDD 15 kHz, TDD 15 kHz and TDD 30 kHz, respectively, from the start of T3 until 200 ms excludes 150 ms for identifying the cell global identifier of Cell 2. | |

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Subtest 1 is not used when testing with 30 kHz SSB SCS.

Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 7: $\Delta_{BG_offset}$ is defined in clause 3A.4, Table 3A.4.1-2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Subtest 1 is not used when testing with 30 kHz SSB SCS.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRQ, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.

Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 7: Subtest 2 is not used when testing with 30 kHz SSB SCS.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: SS-SINR, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-SINR, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.
Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-SINR, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-SINR, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.

Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

## 16.7.5 E-UTRAN RSRP for RedCap

### 16.7.5.0 Minimum conformance requirements

#### 16.7.5.0.1 E-UTRAN RSRP absolute accuracy

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 6.7.5.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the requirements for absolute accuracy of RSRP in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 16.7.5.0.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [27] Clause 7.3 for reference sensitivity are fulfilled.

RSRP|dBm according to TS 36.133 [23] Annex B.3.3 for a corresponding band.

# 16.7.6 E-UTRAN RSRQ for RedCap

## 16.7.6.0 Minimum conformance requirements

### 16.7.6.0.1 E-UTRAN RSRQ absolute accuracy

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 6.7.6.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 16.7.6.0.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [27] Clause 7.3 for reference sensitivity are fulfilled.

RSRP|dBm according to TS 36.133 [23] Annex B.3.1 for a corresponding band.

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The condition level is increased by $\Delta > 0$, when applicable, as described in TS 36.133 [23] clauses B.4.2 and B.4.3.
NOTE 4: E-UTRA operating band groups are as defined in TS 36.133 [23] clause 3.5.

The reporting range and mapping specified for RSRP measurements in clause 9.1.4 of TS 36.133 [23] shall apply.

# 17 NR standalone tests in FR2 for RedCap

## 17.1 RRC_IDLE state mobility for RedCap

### 17.1.1 NR cell re-selection for RedCap

#### 17.1.1.0 Minimum conformance requirements

##### 17.1.1.0.1 Minimum conformance requirements for intra-frequency cell re-selection for RedCap

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the re-selection criteria defined in TS 38.304 [30] within $T_{detect,NR_Intra_RedCap}$ when that Treselection = 0. An intra-frequency cell is considered to be detectable according to the conditions defined in TS 38.133 [6] Annex B.1.4 for a corresponding band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra_RedCap}$ for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra_RedCap}/2$.

The UE shall not consider a NR neighbour cell in cell re-selection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met re-selection criterion defined in TS 38.304 [30] within $T_{evaluate,NR_Intra_RedCap}$ when $T_{reselection} = 0$ provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 4.5 dB better ranked in FR2 for 2 Rx RedCap.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [30] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

- if there are multiple such cells, the cell has the highest rank among them.

- the cell is at least 4.5 dB better ranked in FR2 if the current serving cell is among them for 2 Rx RedCap.

When evaluating cells for re selection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the intra-frequency cell is satisfied with the re-selection criteria which are defined in TS 38.304 [30], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the re-selection criteria within this duration, then the UE shall reselect that cell.

For 2 Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in Table 17.1.1.0.1-1.

For 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in Table 17.1.1.0.1-2 for FR2, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and is the same in all PTWs during any of $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ when multiple PTWs are used.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, being configured with eDRX_IDLE cycle, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

### 17.1.1.0.2 Minimum conformance requirements for inter-frequency cell re-selection for RedCap

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in TS 38.133 [6] in clause 4.2.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible re-selection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the re-selection criteria defined in TS 38.304 [30] within $K_{carrier_RedCap} * T_{detect,NR_Inter_RedCap}$ if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection} = 0$ provided that the re-selection criteria is met

For 2 Rx RedCap by a margin of at least

5 dB in FR1 or 6.5 dB in FR2 for re-selections based on ranking or

7.5 dB in FR2 for SS-RSRP re-selections based on absolute priorities or

4 dB in FR2 for SS-RSRQ re-selections based on absolute priorities

The parameter $K_{carrier_RedCap}$ is the number of NR inter-frequency carriers indicated by the serving cell. An inter-frequency cell is considered to be detectable according to the conditions defined in TS 38.133 [6] in Annex B.1.5 for a corresponding band. When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter_RedCap}$. If, after detecting a cell in a higher priority search, it is determined that re-selection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of re-selection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier_RedCap} * T_{measure,NR_Inter_RedCap}$ for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell re-selection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met re-selection criterion defined TS 38.304 [30] within $K_{carrier} * T_{evaluate,NR_Inter_RedCap}$ when $T_{reselection} = 0$ provided that the re-selection criteria is met by

- the condition when performing equal priority re-selection and
  - when *rangeToBestCell* is not configured:
    - the cell is at least 6.5 dB better ranked in FR2 for 2 Rx RedCap.
  - when *rangeToBestCell* is configured:
    - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value defined in TS 38.304 [30] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
      - if there are multiple such cells, the cell has the highest rank among them
      - the cell is at least 6.5 dB better ranked in FR2 if the current serving cell is among them, or 7.5 dB in FR2 for SS-RSRP re-selections based on absolute priorities for 2 Rx RedCap or 4 dB in FR2 for SS-RSRQ re-selections based on absolute priorities for 2 Rx RedCap.

When evaluating cells for re-selection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the re-selection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the re-selection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle = 320 ms defined in TS 38.133 [6] in Table 17.1.1.0.2-1 for 2 Rx RedCap under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where $T_{SMTC_intra}$ and $T_{SMTC_inter}$ are periodicities of the SMTC occasions configured for the intra-frequency carrier and the inter-frequency carrier respectively, and
- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion defined in TS 38.304 [30].

For Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in Table 17.1.1.0.2-1.

For 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in Table 17.1.1.0.2-2 for FR2. The requirements apply provided that the serving cell is configured with eDRX_IDLE and is the same in all PTWs during any of $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ when multiple PTWs are used.

NOTE 2: The number of DRX cycles in this table is given for the DRX cycles within PTWs.
NOTE 3: The eDRX_IDLE cycle lengths are as specified in clause 10.5.5.32 of TS 24.008 [34].
NOTE 4: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s and 10.24 s. Otherwise, number of DRX cycles.
NOTE 5: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Inter_RedCap * DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 6: When eDRX = 20.48 s and DRX = 0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, being configured with eDRX_IDLE cycle, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

### 17.1.1.0.3 Minimum conformance requirements for intra-frequency cell re-selection for RedCap UE configured with stationary relaxed measurement criterion

This clause contains requirements for measurements on intra-frequency NR cells provided that:

- UE is configured with *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and UE has fulfilled that criterion, or

- UE is configured with both *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and *cellEdgeEvaluationWhileStationary* defined in TS 38.331 [13] criterion and *combineRelaxedMeasCondition2* defined in TS 38.331 [13] not configured, and UE has fulfilled only the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion

The requirements defined in clause 17.1.1.0.3 apply for this clause except that:

- $T_{detect,NR_Intra_RedCap_Relax}$ as specified in Table 17.1.1.0.3-1 for 2 Rx RedCap.

- $T_{measure,NR_Intra_RedCap_Relax}$ as specified in Table 17.1.1.0.3-1 for 2 Rx RedCap.

- $T_{evaluate,NR_Intra_RedCap_Relax}$ as specified in Table 17.1.1.0.3-1 for 2 Rx RedCap.

If the UE is configured with eDRX_IDLE cycle then the requirements in Table 17.1.1.0.3-2 are applicable for eDRX cycle up to 10.24 s in FR2.

If the UE is configured with eDRX_IDLE cycle greater than 10.24 s in FR2, then the requirements in Table 17.1.1.0.3-3 apply provided eDRX cycle is ≤ 163.84 sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW window length.

Note 2: The number of DRX cycles in this table is given for the DRX cycles within PTWs.
Note 3: The eDRX_IDLE cycle lengths are as specified in clause 10.5.5.32 of TS 24.008 [34].
Note 4: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Intra_RedCap_Relax * DRX_cycle}{1.28} \right\rceil * 1.28.$
Note 5: The measurement shall not be performed across PTW's. In this case the measurement is performed in the next available PTW.
Note 6: The evaluation shall not be performed across PTW's. In this case the evaluation is performed in the next available PTW.
Note 7: For DRX cycle length is 0.32 s, 0.64 s, and 2.56 s, K3 = 6 is the measurement relaxation factor applicable for UE fulfilling the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion. For DRX cycle length is 1.28 s, K3 = 4 is the measurement relaxation factor applicable for UE fulfilling the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion.

### 17.1.1.0.4 Minimum conformance requirements for inter-frequency cell re-selection for RedCap UE configured with stationary relaxed measurement criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- UE is configured with *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and UE has fulfilled that criterion, or
- UE is configured with both *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and *cellEdgeEvaluationWhileStationary* defined in TS 38.331 [13] criterion and *combineRelaxedMeasCondition2* defined in TS 38.331 [13] not configured, and UE has fulfilled only the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion, and

The requirements defined in clause17.1.1.0.4 apply for this clause except that:

- $T_{detect,NR_Inter_RedCap_Relax}$ as specified in Table 17.1.1.0.4-1 for 2 Rx RedCap.
- $T_{measure,NR_Inter_RedCap_Relax}$ as specified in Table 17.1.1.0.4-1 for 2 Rx RedCap.
- $T_{evaluate,NR_Inter_RedCap_Relax}$ as specified in Table 17.1.1.0.4-1 and for 2 Rx RedCap.
- When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every K2*$T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in TS 38.133 [6] in clause 4.2.2.7 and, K2 = 240.

If the UE is configured with eDRX_IDLE cycle then the requirements in Table 17.1.1.0.4-2 are applicable for eDRX cycle up to 10.24 s in FR2.

If the UE is configured with eDRX_IDLE cycle greater than 10.24 s FR2, then the requirements in Table 17.1.1.0.4-3 apply provided that eDRX cycle is ≤ 163.84 sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW window length.

#### 17.1.1.1.4.2 Test procedure

Two cells are deployed in the test, which are one FR2 NR PCell (Cell 1) and an NR neighbour cell (Cell 2) on the same frequency. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

In the following test procedure "UE responds" means "UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1. Set Cell 2 physical cell identity = initial Cell 2 physical cell identity.

2. Set the parameters according to T1 in Table 17.1.1.1.5-1. T1 starts.

3. Set Cell 2 physical cell identity = ((current Cell 2 physical cell identity + 3) mod 1008) for one iteration of the test procedure loop.

4. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.1.5-1.

5. The SS waits for random access requests information from the UE to perform cell re-selection to a newly detectable cell, Cell 2.

6. If the UE responds on the newly detectable cell, Cell 2 during time duration T2 within 130 seconds from the beginning of time period T2, then count a success for the event "Re-select newly detected Cell 2". Otherwise, count a failure for the event "Re-select newly detected Cell 2".

7. If the UE has re-selected Cell 2 within T2, after the re-selection or when T2 expires, continue with step 8. Otherwise, if T2 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and skip to step 14.

8. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 2.

9. The SS shall switch the power setting from T2 to T3 as specified in Table 17.1.1.1.5-1.

10. The SS waits for random access requests information from the UE to perform cell re-selection to an already detected cell, Cell 1.

11. If the UE responds on the already detected cell, Cell 1 during time duration T3 within 27 seconds from the beginning of time period T3, then count a success for the event "Re-select already detected Cell 1". Otherwise, count a fail for the event "Re-select already detected Cell 1".

12. If the UE has re-selected Cell 1 within T3, after the re-selection or when T3 expires, continues with step 13. Otherwise, if T3 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 14.

13. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 1.

14. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

15. Repeat steps 2-14 until a test verdict has been achieved.
    Each of the events "Re-select newly detected Cell 2" and "Re-select already detected Cell 1" is evaluated independently for the statistic, resulting in an event verdict: pass or fail. Each event is evaluated only until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved. Different events may require

different times for a verdict.
If both events pass, the test passes. If one event fails, the test fails.

### 17.1.1.2.4.2 Test procedure

Two cells on two RF channels are deployed in the test, which are one FR2 NR PCell (Cell 2) on RF channel 1 and an NR neighbour cell (Cell 1) on RF channel 2. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 2 is already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 2. Set Cell 1 physical cell identity = initial Cell 1 physical cell identity.

2. Set the parameters according to T1 in Table 17.1.1.2.5-1. T1 starts.

3. The SS waits for random access requests information from the UE to perform cell re-selection on the lower priority cell, Cell 1.

4. If the UE responds on lower priority cell, Cell 1 during time duration T1 within 27 seconds from the beginning of time period T1, then count a success for the event “Re-select lower priority Cell 1”. Otherwise, count a fail for the event “Re-select lower priority Cell 1”.

5. If the UE has re-selected Cell 1 within T1, after the re-selection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 13.

6. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 1.

7. The SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.2.5-1. During time duration T2, Cell 2 shall be powered OFF and the physical cell identity = ((current Cell 2 physical cell identity + 1) mod 1008) shall be changed to ensure Cell 2 is not detected by the UE.

8. When T2 expires, the SS shall switch the power setting from T2 to T3 as specified in Table 17.1.1.2.5-1.

9. The SS waits for random access requests information from the UE to perform cell re-selection on the higher priority cell, Cell 2.

10. If the UE responds on higher priority cell, Cell 2 during time duration T3 within 87 seconds from the beginning of time period T3, then count a success for the event “Re-select higher priority Cell 2”. Otherwise, count a fail for the event “Re-select higher priority Cell 2”.

11. If the UE has re-selected Cell 2 within T3, after the re-selection or when T3 expires, continues with step 12. Otherwise, if T3 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and continue with step 13.

12. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 2.

13. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 2.

14. Repeat steps 2-13 until a test verdict has been achieved.
    Each of the events “Re-select lower priority Cell 1” and “Re-select higher priority Cell 2” is evaluated independently for the statistic, resulting in an event verdict: pass or fail. Each event is evaluated only until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved. Different events may require different times for a verdict.
    If both events pass, the test passes. If one event fails, the test fails.

#### 17.1.1.3.4.2 Test procedure

Two cells are deployed in the test, which are one FR2 NR PCell (Cell 1) and an NR neighbour cell (Cell 2) on the same frequency. The test consists of 2 successive time periods, with time duration of T1 and T2 respectively. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas.

The UE is configured only low mobility criterion defined in clause 5.2.4.9.1 in TS 38.304 [30]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation-r17* defined in TS 38.331 [13] is configured according to the parameters listed in Table 17.1.1.3.5-1;
- cellEdgeEvaluationWhileStationary-r17 defined in TS 38.331 [13] is not configured;
- combineRelaxedMeasCondition2-r17 defined in TS 38.331 [13] is not configured.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a Registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to T1 in Table 17.1.1.3.5-1. T1 starts.
3. The SS waits for random access requests information from the UE to perform cell re-selection to Cell 2.
4. If the UE responds on Cell 2 during time duration T1 within 155 seconds from the beginning of time period T1, then count a success for cell reselection. Otherwise, count a fail for cell reselection.
5. If the UE has re-selected Cell 2 within T1, after the re-selection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and skip to step 11.

6 The SS shall send an *RRCRelease* to ensure that the UE is in state RRC_IDLE.

6. The SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.3.5-1. T2 starts.
8. The SS waits for random access requests information from the UE to perform cell re-selection to an already detected cell, Cell 1.
9. If the UE responds to Cell 1 during time duration T2 within 155 seconds from the beginning of time period T2, then count a success for cell reselection. Otherwise, count a fail for cell reselection.
10. If T2 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and continue with step 11.
11. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
12. Repeat steps 2-11 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

| Note 6: | Including the test tolerance given in Annex F. |

The cell re-selection delay to an already detected cell for UE fulfilling stationary relaxed criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 2.

The cell re-selection delay to an already detected cell shall be less than 155 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to an already detectable cell can be expressed as: $T_{evaluate,NR_Intra_RedCap_Relax} + T_{SI-NR}$,

Where:

$T_{evaluate,NR_Intra_RedCap_Relax}$ See Table 4.2B.2.9.2-2 in clause 4.2B.2.9.2,

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 154.88 s, allow 155 s for the cell reselection delay to an already detected cell for UE fulfilling stationary criterion in the test case.

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

#### 17.1.1.4.4.2 Test procedure

The test consists of one active cell and one neighbour cell on two different NR RF channels. The UE is requested to monitor the neighbouring cell on one of the NR carriers. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas and Cell 2 is of higher priority than Cell 1.

The UE is configured only low mobility criterion defined in clause 5.2.4.9.1 in TS 38.304 [30]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation-r17* defined in TS 38.331 [13] is configured according to the parameters listed in Table 17.1.1.4.5-1;
- *cellEdgeEvaluationWhileStationary-r17* defined in TS 38.331 [13] is not configured;
- *combineRelaxedMeasCondition2-r17* defined in TS 38.331 [13] is not configured.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a Registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to T1 in Table 17.1.1.4.5-1. T1 starts.
3. The SS waits for random access requests information from the UE to perform cell reselection to Cell 1.
4. If the UE responds on lower priority Cell 1 during time duration T1 within 155 seconds from the beginning of time period T1, then count a success for the event “Re-select lower priority Cell 1”. Otherwise, count a fail for the event “Re-select lower priority Cell 1”.
5. If the UE has re-selected Cell 1 within T1, after the reselection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 11.
6. The SS shall send an *RRCRelease* to ensure that the UE is in state RRC_IDLE.
7. The SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.4.5-1. T2 starts.
8. The SS waits for random access requests information from the UE to perform cell reselection to an already detected cell, Cell 2.
9. If the UE responds to higher priority Cell 2 during time duration T2 within 155 seconds from the beginning of time period T2, then count a success for the event “Re-select higher priority Cell 2”. Otherwise, count a fail for the event “Re-select higher priority Cell 2”.

10. If T2 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and continue with step 11.

11. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

12. Repeat steps 2-11 until a test verdict has been achieved.
    Each of the events “Re-select lower priority Cell 1” and “Re-select higher priority Cell 2” is evaluated independently for the statistic, resulting in an event verdict: pass or fail. Each event is evaluated only until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved. Different events may require different times for a verdict.
    If both events pass, the test passes. If one event fails, the test fails.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SSB_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

Note 5: Calculation of $Es/Iot_{BB}$ includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor $\Delta MB_P$ from TS 38.101-2 [3] Table 6.2.1.3-4.

Note 6: Including the test tolerance given in Annex F.

The cell re-selection delay to an already detected low priority cell (Cell 1) for UE fulfilling stationary criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 1.

The cell re-selection delay to an already detected low priority cell, Cell 1, shall be less than 155 s.

The cell re-selection delay to an already detected high priority cell (Cell 2) for UE fulfilling stationary criterion is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2 and starts to

send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 2.

The cell re-selection delay to an already detected high priority cell, Cell 2, shall be less than 155 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90%.

NOTE 1: The cell re-selection delay to an already detected low priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap_Relax} + T_{SI\text{-}NR}$

NOTE 2: The cell re-selection delay to an already detected higher priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap_Relax} + T_{SI\text{-}NR}$

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

# 17.2 RRC_INACTIVE state mobility for RedCap

## 17.2.1 Configured Grant based Small Data Transmissions for RedCap

### 17.2.1.0 Minimum conformance requirements

#### 17.2.1.0.1 Minimum conformance requirements for TA validation using CG-SDT

The requirements in this clause are applicable when the UE is configured with timing alignment (TA) validation using *cg-SDT-RSRP-ChangeThreshold* for transmitting in uplink using CG-SDT as specified in TS 38.331 [13].

The requirements in this clause are applicable for the UE performing small data tranmissions using configured resources as TS 38.331 [13].

The UE is allowed to transmit using the configured uplink resources provided that the UE is synchronized towards (i.e. using the timing derived using the latest available $N_{TA}$ value as specified in subclause 7.1.2) the serving cell prior to transmission. If the UE is not able to obtain the synchronization towards the serving cell then the UE shall drop the small data transmission. The UE determines the small data transmission occasion according to the received CG-SDT configuration as specified in TS 38.331 [13].

When *cg-SDT-RSRP-ChangeThreshold* as specified in TS 38.331 [13] is configured for TA validation based on the RSRP change criterion according to clause 5.8.2 in TS 38.321 [12], the UE is allowed to transmit using CG-SDT using the timing derived using the latest available $N_{TA}$ value as specified in TS 38.133 [6] subclause 7.1 provided that

- the first RSRP ($RSRP_1$) measurement and the second RSRP ($RSRP_2$) measurements used in the TA validation are valid measurements and,
- timing alignment validation for transmission using CG-SDT is valid according to the validation criteria in clause 5.8.2 in TS 38.321 [12].

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in Table 17.2.1.0.1-1 are met for FR2-1 regardless of whether the UE is configured with eDRX cycle by serving gNB or core network (AMF).

**Table 17.2.1.0.1-1: Valid measurement for FR2-1**

| Measurement | FR2-1 |
|---|---|
| $RSRP_1$ | (T1 – max{480 ms, 8*SMTC periodicity}) ≤ T1' ≤ (T1 + max{480 ms, 8*SMTC periodicity}) |
| $RSRP_2$ | (T2 – max{480 ms, 8*SMTC periodicity}) ≤ T2' ≤ T2 |

If at least one of $RSRP_1$ and $RSRP_2$ is considered to be invalid based on the above conditions, then the UE shall not validate the CG-SDT using $RSRP_1$ and $RSRP_2$ and shall not transmit using CG-SDT. Additionally, for the initial CG-SDT transmission, the UE shall not transmit in an CG-SDT occasion that occurs more than 640 ms after T2.

Where:

- T1 is the time when

- *RRCRelease* with CG-SDT configuration (TS 38.331 [13]) is received, or
- the latest TA is received if TA is received while in RRC_INACITVE state.

- T1' is the time when the UE has completed $RSRP_1$.
- T2 is the time when the UE performs TA validation as defined in TS 38.321 [12] clause 5.27.2 for transmission using CG-SDT.
- T2' is the time when the UE has completed $RSRP_2$.
- $T_{DRX}$ is the DRX cycle length in ms.
- M1 the scaling factor as defined in TS 38.133 [6] clause 4.2.2.2.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* as specified in TS 38.331 [13] the following restrictions apply due to SS-RSRP/RSRQ measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.
- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on all symbols within SMTC window duration.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* as specified in TS 38.331 [13] the following restrictions apply due to measurement of serving cell.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols of the serving cell.

The UE is not required to meet the following measurement requirements during subsequent SDT transmissions:

- Measurements of inter-frequency NR cells in TS 38.133 [6] clause 5.1.2.4
- Measurements of inter-RAT E-UTRAN cells in TS 38.133 [6] clause 5.1.2.5
- Idle Mode CA/DC Measurements in TS 38.133 [6] clause 5.4

The UE is allowed to delay the reception of PRS resources on the positioning frequency layer until the SDT session is completed if the measurement using PRS resource overlaps with the SDT resources.

The normative reference for this requirement is TS 38.133 [6] clauses 5.2B.

# 17.3 RRC_CONNECTED state mobility for RedCap

## 17.3.1 Handover for RedCap

### 17.3.1.0 Minimum conformance requirements

#### 17.3.1.0.1 Minimum conformance requirements for NR FR2 – NR FR2 handover

The purpose of NR handover is to change the NR PCell to another NR cell for RedCap UE. The requirements in this clause are applicable to SA NR.

Handover for a RedCap UE is defined as intra-frequency handover if the center frequency and subcarrier spacing (SCS) of the reference SSB of the serving cell is same as the center frequency and SCS of the reference SSB of the target cell, where:

The reference SSB of the serving cell is the SSB in the active DL BWP of serving cell,

The reference SSB of the target cell is the SSB in the first active DL BWP of the target cell upon reconfiguration.

The requirements in this clause apply for the following handover scenarios:

Handover to a target cell's initial DL BWP associated with CD-SSB;

Handover to a target cell's Redcap specific DL BWP associated with NCD-SSB.

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR2 cell to NR FR2 cell.

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [13] plus the interruption time.

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

$T_{search}$ is the time required to search the target cell which depends on whether the target cell is already known when the handover command is received by the UE.

- If the target cell is a known intra-frequency cell, $T_{search}$ = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot ≥ -2 dB, then $T_{search}$ = 8*$T_{rs}$ ms.

- If the target cell is a known inter-frequency cell, then

  if the measured SSB is the target SSB for HO of the target cell, $T_{search}$ = 0 ms;

  if the measured SSB and the target SSB for HO belong to the same NR target cell and fulfil the following conditions, $T_{search}$ = $T_{rs}$ ms:

  - CD-SSB in initial DL BWP is the measured SSB and NCD-SSB in RedCap specific DL BWP is the target SSB for HO
  - NCD-SSB in RedCap specific DL BWP is the measured SSB and CD-SSB in initial DL BWP is the target SSB for HO
  - Both measured SSB and the target SSB for HO are NCD-SSBs within different RedCap specific DL BWPs

  Otherwise, the target cell is an unknown inter-frequency cell. In this case, if the target cell Es/Iot ≥ -2 dB, then $T_{search}$ = 24 * $T_{rs}$ ms.

Regardless of whether DRX is in use by the UE, $T_{search}$ shall still be based on non-DRX target cell search times.

$T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta}$ = $T_{rs}$ for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

$T_{margin}$ is time for SSB post-processing. $T_{margin}$ can be up to 2 ms.

$T_{IU}$ is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. $T_{IU}$ can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the Table 8.1-1 of TS 38.213 [8].

$T_{rs}$ is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise,

- $T_{rs}$ is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing as NCD-SSB indicated by *nonCellDefiningSSB-r17* if the first active DL BWP included in handover command is configured with *nonCellDefiningSSB-r17*, otherwise, as CD-SSB indicated by *absoluteFrequencySSB* in *frequencyInfoDL* in handover command.
- If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [13] signaling of *smtc2* prior to the handover command, $T_{rs}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In FR2, the target cell is known if it has been meeting the following conditions:

- At least one of the SSBs measured belongs to the same NR target cell,
- During the last 5 seconds before the reception of the handover command:
  - the UE has sent a valid measurement report for the target cell and
  - at least one of the SSBs measured which belongs to the same NR target cell remains detectable according to the cell identification requirements as described in TS 38.133 [6] clause 9.2B for intra-frequency measurements and TS 38.133 [6] clause 9.3B for inter-frequency measurements,
- The reference SSB of the NR target cell also remains detectable during the handover delay according to the cell identification requirements are described in TS 38.133 [6] clause 9.2B for intra-frequency handover and TS 38.133 [6] clause 9.3B for inter-frequency handover.

Otherwise, it is unknown.

The normative reference for this requirement is TS 38.133 [6] clauses 6.1D.1.1 and 6.1D.1.3.

- The test is incomplete for UE power classes other than PC3
- The test is incomplete for test frequencies > 40.8 GHz

#### 17.3.1.2.1 Test purpose

#### 17.3.1.2.4 Test description

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively.

- At the start of time duration T1, the UE does not have any timing information of Cell 2.
- Starting T2, Cell 2 becomes detectable and the UE receives an RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP, where Cell 2's DL BWP is the Redcap specific BWP associated with NCD-SSB, then UE handover from Cell 1's NCD-SSB to Cell 2's specific Redcap BWP associated with NCD-SSB. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell and its RedCap-specific dedicated BWP is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[ \left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

7. After T2 expires, the SS shall
   - transmit an *RRCReconfiguration* message to cause the UE handover back to Cell 1. if the handover fails, switch off and on the UE

   or

   - switch off and on the UE.
8. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell and its RedCap-specific dedicated BWP is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency given in step 1.

The handover delay is measured from the beginning of time period T2 to the time that the UE transmit the first PRACH to Cell 2, which is calculated as follows:

Handover delay = RRC procedure delay + $T_{interrupt}$

- RRC procedure delay = 10 ms, is the RRC processing delay specified in TS 38.331 [13] clause 12,
- $T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin}$, is the interruption time specified in TS 38.133 [6] clause 6.1D.1.2.
  - $T_{search}$ = 1920 ms, is the time required to search the unknown target cell;
  - $T_{IU}$ = 20 ms, is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.
  - $T_{processing}$ = 20 ms, is time for UE processing;
  - $T_{\Delta}$ = 80 ms, is time for fine time tracking and acquiring full timing information of the target cell;
  - $T_{margin}$ = 2 ms, is time for SSB post-processing.

This gives a total of 2052 ms.

# 17.4 Timing for RedCap

## 17.4.1 UE transmit timing for RedCap

### 17.4.1.0 Minimum Conformance Requirements

#### 17.4.1.0.1 Minimum conformance requirements for UE transmit timing accuracy

The UE shall have capability to follow the frame timing change of the reference cell in connected state or when transmiting PUSCH on CG resources for SDT in RRC_Inactive. The uplink frame transmission takes place $(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_{\mathrm{c}}$ before the reception of the first detected path (in time) of the corresponding downlink frame from

the reference cell. UE initial transmit timing accuracy and gradual timing adjustment requirements are defined in the following requirements.

The UE initial transmission timing error shall be less than or equal to $\pm T_e$ where the timing error limit value $T_e$ is specified in Table 17.4.1.0.1-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission.
- when it is the transmission for PUSCH on CG resources for SDT in RRC_Inactive.

The UE shall meet the $T_e$ requirement for an initial transmission provided that at least one SSB (CD-SSB or NCD-SSB) is available at the UE for acquiring the frame timing of the reference cell during the last 160 ms on the condition that:

- the SSB is within the UE's active BWP, or
- the SSB is not within the UE's active BWP, and the measurement gap is configured.

The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_{\mathrm{c}}$. The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the UE to determine downlink timing is received from the reference cell at UE antenna. $N_{\mathrm{TA}}$ for PRACH is defined as 0.

$(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_{\mathrm{c}}$ (in $T_c$ units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in TS 38.133 [6] clause 7.3A was applied. $N_{\mathrm{TA}}$ for other channels is not changed until next timing advance is received. The value of $N_{\mathrm{TA\,offset}}$ depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR). $N_{\mathrm{TA\,offset}}$ is defined in Table Table 17.4.1.0.1-2.

**Table 17.4.1.0.1-1: $T_e$ Timing Error Limit**

| Frequency Range | SCS of SSB signals (kHz) | SCS of uplink signals (kHz) | $T_e$ |
|---|---|---|---|
| 2 | 240 | 120 | $3*64*T_c$ |
| Note 1: $T_c$ is the basic timing unit defined in TS 38.211 [7]. | | | |

**Table 17.4.1.0.1-2: The Value of $N_{\mathrm{TA\,offset}}$**

| Frequency range and band of cell used for uplink transmission | $N_{\mathrm{TA\,offset}}$ (Unit: $T_C$) |
|---|---|
| FR2 | 13792 |

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH and SRS transmission, the UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell except when the timing advance in TS 38.133 [6] clause 7.3A is applied.

When the transmission timing error between the UE and the reference timing exceeds $\pm T_e$ then the UE is required to adjust its timing to within $\pm T_e$. The reference timing shall be $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_{\mathrm{c}}$ before the downlink timing of the reference cell. All adjustments made to the UE uplink timing shall follow these rules:

1) The maximum amount of the magnitude of the timing change in one adjustment shall be $T_q$.
2) The minimum aggregate adjustment rate shall be $T_p$ per second.
3) The maximum aggregate adjustment rate shall be $T_q$ per 200 ms.

   where the maximum autonomous time adjustment step $T_q$ and the aggregate adjustment rate $T_p$ are specified in Table 17.4.1.0.1-3.

**Table 17.4.1.0.1-3: $T_q$ Maximum Autonomous Time Adjustment Step and $T_p$ Minimum Aggregate Adjustment rate**

| Frequency Range | SCS of uplink signals (kHz) | $T_q$ | $T_p$ |
|---|---|---|---|
| 2 | 120 | 2.5*64*$T_c$ | 2.5*64*$T_c$ |
| NOTE: $T_c$ is the basic timing unit defined in TS 38.211 [7]. | | | |

# 17.5 Signalling characteristics for RedCap

## 17.5.1 Radio link monitoring for RedCap

### 17.5.1.0 Minimum requirements

#### 17.5.1.0.1 General

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [8]. The configured RLM-RS

resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP. The SSB and SMTC in this section applies for both CD-SSB and NCD-SSB if it is not additional specified.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out}$ and $Q_{in}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in Table 17.5.1.0.1-1. For SSB based radio link monitoring, $Q_{out_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-2. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-4.

The threshold $Q_{in}$ is defined as the level at which the downlink radio link quality can be significantly more reliably received than at $Q_{out}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in Table 17.5.1.0.1-1. For SSB based radio link monitoring, $Q_{in_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-3. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-5.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *RLM-IS-OOS-thresholdConfig* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in Table 17.5.1.0.1-1 as default. All requirements here are applicable for BLER Configuration #0 in Table 17.5.1.0.1-1.

**Table 17.5.1.0.1-1: Out-of-sync and in-sync block error rates**

| Configuration | $BLER_{out}$ | $BLER_{in}$ |
|---|---|---|
| 0 | 10% | 2% |

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [8], where $N_{RLM}$ is specified in Table 17.5.1.0.1-6 according TS 38.213 [8], and meet the requirements as specified in TS 38.133 [6] clause 8.1B. UE is not required to meet the requirements in TS 38.133 [6] clause 8.1B if RLM-RS is not configured and no TCI state for PDCCH is activated.

When the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource during one evaluation period, the UE is allowed to restart the ongoing evaluation using the second SSB type after BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

The requirements in TS 38.133 [6] clause 8.1.4 shall also apply except the scenarios described above.

The requirements in TS 38.133 [6] clause 8.1.5 shall apply.

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out}$, Layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A Layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [13].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,RedCap}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [13].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [8]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,RedCap}$.

When DRX is not used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM-RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in TS 38.133 [6] clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI-RS}$ specified in TS 38.133 [6] clause 8.1B.3 if the RLM-RS resource is CSI-RS.

In case DRX is used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM-RS,M}$)) if DRX cycle_length is less than or equal to 320 ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX cycle_length is greater than 320 ms. Upon start of T310 timer as specified in TS 38.331 [13], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE is expected to receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE is expected to receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

The normative reference for this requirement is TS 38.133 [6] clauses 8.1B.1, 8.1B.2, 8.1B.3, 8.1B.4, 8.1B.5, 8.1B.6 and 8.1B.7.

### 17.5.1.0.2 Minimum conformance requirements for SSB-based RLM

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in this clause.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,RedCap}$ ms period becomes worse than the threshold $Q_{out_SSB,RedCap}$ within $T_{Evaluate_out_SSB,RedCap}$ ms evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,RedCap}$ ms period becomes better than the threshold $Q_{in_SSB,RedCap}$ within $T_{Evaluate_in_SSB,RedCap}$ ms evaluation period.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in Table 17.5.1.0.2-1 and for FR2 with scaling factor N = 8 for 2 Rx RedCap.

**Table 17.5.1.0.2-1: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ for FR2 for 2 Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(10 × P × N) × $T_{SSB}$) | Max(100, Ceil(5 × P × N) × $T_{SSB}$) |
| DRX cycle ≤ 320 ms | Max(200, Ceil(15 × P × N) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P × N) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(10 × P × N) × $T_{DRX}$ | Ceil(5 × P × N) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the RLM-RS is partially overlapped with measurement gap and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MRGP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod}$ < MGRP)

- $P_{sharing\ factor}$ = 1, if the RLM-RS resource outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

Longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

For FR2, when the SSB for RLM measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

The normative reference for this requirement is TS 38.133 [6] clause 8.1B.2.

### 17.5.1.0.3 Minimum conformance requirements for CSI-RS based RLM

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in this clause. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ ms period becomes worse than the threshold $Q_{out_CSI\text{-}RS,RedCap}$ within $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ ms evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS,RedCap}$ ms period becomes better than the threshold $Q_{in_CSI-RS,RedCap}$ within $T_{Evaluate_in_CSI-RS,RedCap}$ ms evaluation period.

$T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ are defined in Table 17.5.1.0.3-1 for FR2 with scaling factor N = 1 for 2 Rx RedCap.

**Table 17.5.1.0.3-1: Evaluation period $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ for FR2 for 2 Rx RedCap UE**

| Configuration | $T_{Evaluate_out_CSI-RS,RedCap}$ (ms) | $T_{Evaluate_in_CSI-RS,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out,RedCap}$×P×N)×$T_{CSI-RS}$) | Max(100, Ceil($M_{in,RedCap}$×P×N) × $T_{CSI-RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out,RedCap}$×P×N)× Max($T_{DRX}$, $T_{CSI-RS}$)) | Max(100, Ceil(1.5×$M_{in,RedCap}$×P×N)× Max($T_{DRX}$, $T_{CSI-RS}$)) |
| DRX > 320 ms | Ceil($M_{out,RedCap}$×P×N) × $T_{DRX}$ | Ceil($M_{in,RedCap}$×P×N) × $T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

For FR2,

- P = 1, when the RLM-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is not overlapped with SMTC occasion ($T_{CSI-RS}$ < MGRP)
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq$ MGRP or
  - $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod}$ < MGRP)
- $P_{sharing\ factor}$ = 1, if the RLM-RS resource outside measurement gap is

- not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; 0therwise $T_{SMTCperiod}$ follows *smtc1*.

Note: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

The values of $M_{out,RedCap}$ and $M_{in,RedCap}$ used in Table 17.5.1.0.3-1 for UE with 2 Rx are defined as:

- $M_{out,RedCap}$ = 20 and $M_{in,RedCap}$ = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

Longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement, or in the same symbol as SSB for CBD when beam failure is detected, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or

  - The other CSI-RS is configured in q1 and beam failure is detected, or

  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,

- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

The normative reference for this requirement is TS 38.133 [6] clause 8.1B.3.

#### 17.5.3.1.0 Minimum conformance requirements for DCI-based and time-based active BWP switch

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y = 0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL half-subframe (FR2) immediately after a BWP-inactivity timer *bwp-InactivityTimer* defined in TS 38.331 [13] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* defined in TS 38.331 [13] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* defined in TS 38.331 [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in Table 17.5.3.1.0-1.

**Table 17.5.3.1.0-1: BWP switch delay**

| $\mu$ | NR Slot length (ms) | BWP switch delay $T_{BWPswitchDelay}$ (slots) | |
|---|---|---|---|
| | | Type 1[Note 1] | Type 2[Note 1] |
| 3 | 0.125 | 6 | 18 |
| Note 1: Depends on UE capability.<br>Note 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. | | | |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in TS 38.133 [6] clause 8.10 in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in TS 38.133 [6] clause 8.10 in the new BWP.

The normative reference for this requirement is TS 38.133 [6] clause 8.6A.2.

2. Message contents are defined in clause 17.5.3.1.1.4.3.

3. The test scenario comprises of one NR PCell (Cell 1). Cell 1 is configured according to Annex C.1.2 and C.1.3.

| T2 | s | 0.2 | |
| T3 | s | 0.2 | |

### 17.5.3.1.1.4.2 Test procedure

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 1 and the time duration of T2.

The Cell 1 has constant signal levels throughout the test.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to Tables 17.5.3.1.1.4.1-3, 17.5.3.1.1.5-1 and 17.5.3.1.1.5-2.

3. The SS shall transmit an *RRCReconfiguration* message releasing the dedicated configuration of the *initialDownlinkBWP* and the *initialUplinkBWP*. This message also configures 2 different UE-specific bandwidth parts, BWP-1 and BWP-2, which always include the bandwidth of the initial DL BWP and SSB. The SS indicates BWP-1 as the active DL BWP using *firstActiveDownlinkBWP-Id*. UE is configured with a *bwp-InactivityTimer* timer value for Cell 1.

4. The SS sends a DCI format 1_1 to trigger Cell 1 DL BWP switch. T1 starts from the slot (denoted as slot #i) in which the UE receiving the DCI format 1_1.

5. If the UE,

   - starts to report valid ACK/NACK for Cell 1 on BWP-2 from the first UL slot that occurs after the beginning of DL slot ($i$+$T_{BWPswitchDelay}$+$k_1$),

   then count a success for the event "DCI-based", go to step 6. Otherwise, count a fail for the event "DCI-based", switch off/on the UE and go to step 1.

6. T2 starts. During T2 the SS stops scheduling DL reception on Cell 1 to let timer *bwp-InactivityTimer* expire.

7. T3 starts from the first slot (denoted as slot #j) of the DL half-frame immediately after the timer *bwp-InactivityTimer* expires. During T3 the SS restarts scheduling DL reception on Cell 1.

8. If the UE,

   - starts to report valid ACK/NACK for Cell1 on BWP 1 from the first UL slot that occurs after the beginning of DL slot ($j$+$T_{BWPswitchDelay}$+$k_1$). The number of successful subtests is increased by one and go to step 9 after T3 expires. Otherwise, count a fail for the test, switch off/on the UE and go to step 1.

   then count a success for the event "Timer-based", go to step 9. Otherwise, count a fail for the event "Timer-based", switch off/on the UE and go to step 1.

9. Repeat steps 4-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

If all events pass, the test passes. If one event fails, the test fails.

Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 2: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone

Note 6: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

During T1, the UE shall start to send the ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot ($i + T_{BWPswitchDelay} + k_1$).

During T3, the UE shall start to send the ACK/NACK for PCell from the first UL slot that occurs right after the beginning of DL slot ($j + T_{BWPswitchDelay} + k_1$).

Where, $k_1$ is the timing between DL data receiving and acknowledgement as specified in TS 38.214 [9].

Depending on UE capability *bwp-SwitchingDelay* defined in TS 38.331 [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in TS 38.133 [6] Table 8.6A.2-1.

All of the above test requirements shall be fulfilled in order for the observed PCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK/NACK in the first UL slot that occurs after beginning of DL slot ($i + T_{BWPswitchDelay}+k_1$), ($j + T_{BWPswitchDelay} + k_1$), then the UE shall use the next available uplink resource for reporting the corresponding ACK/NACK.

## 17.5.3.2 RRC-based active BWP switch for RedCap

### 17.5.3.2.0 Minimum conformance requirements for RRC-based active BWP switch

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

Active BWP switch or parameter change of its active BWPs for PCell

Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* and *firstActiveUplinkBWP-Id* for SCell

For RRC-based BWP switch, after the UE receives *RRCreconfiguration* involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessing\,Delay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessing\,Delay}$ is the length of the RRC procedure delay in ms as defined in clause 11.2 in TS 36.331 [29] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [13], and

$T_{BWPswitchDelayRRC} = 6\ ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP switch occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [8].

The normative reference for this requirement is TS 38.133 [6] clauses 8.6A.3.

### 17.5.3.2.1.4.2 Test procedure

The test consists of 1 time period, with duration of T1. Cell 1 has constant signal level throughout the test. PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to Table 17.5.3.2.1.4.1-3, Table 17.5.3.2.1.5-1 and Table 17.5.3.2.1.5-2. Propagation conditions are set according to Annex C clauses C.2.2.

3. The SS shall send an *RRCReconfiguration* message releasing the dedicated configuration of the *initialDownlinkBWP* and the *initialUplinkBWP*. This message also configures another UE-specific bandwidth part, BWP-1 and indicates BWP-1 as the active DL BWP using *firstActiveDownlinkBWP-Id*, according to the initial condition of Active BWP-1 in Table 17.5.3.2.1.5-1.

4. The UE shall transmit an *RRCReconfigurationComplete* message.

5. The SS shall send an *RRCReconfiguration* message with updated bandwidth part configuration for DL BWP switch, change the BWP according to the final condition of Active BWP-1 in Table 17.5.3.2.1.5-1. T1 starts.

6. The UE shall receive the *RRCReconfiguration* in PCell's slot # denoted i and reconfigure its bandwidth part with the updated bandwidth part configuration.

7 If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot $i + X + k_1$ then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one. Where:

   - X = 128 for test configuration 17.5.3.2.1-1;

   - X = 256 for test configuration 17.5.3.2.1-2.

8. After the SS receives the ACK/NACK in step 7) or when T1 expires, the SS shall transmit *RRCRelease* message to release the RRC connection.

9. After the RRC connection release, the SS:

   - transmits in NR Cell 1 a Paging message for the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 (if the paging fails, switches off and on the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5),

   or

   - switches off and on the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

The SS verifies the DL BWP switch time in PCell by counting the slots from the time when the *RRCReconfiguration* message including updated BWP configuration is sent till a valid ACK/NACK is received.

## 17.5.5 Uplink spatial relation switch delay for RedCap

### 17.5.5.1 MAC-CE based Spatial Relation switch for RedCap

#### 17.5.5.1.0 Minimum conformance requirements MAC-CE based uplink spatial relation switch delay

The spatial relation associated to DL RS is known if the following conditions are met:

- During the period from the last transmission of the DL RS resource used for the L1-RSRP measurement reporting for the target spatial relation to the completion of active spatial relation, where the DL RS resource for L1-RSRP measurement is the DL RS in target spatial relation or QCLed to the target spatial relation with QCL type-D.
  - Spatial relation switch command is received within 1280 ms upon the last transmission of the DL RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target spatial relation before the spatial relation switch command
  - The DL RS configured in spatial relation remains detectable during the spatial relation switching period
    - SNR of the DL RS configured in spatial relation ≥ -3 dB
  - The SSB associated with the spatial relation remain detectable during the spatial relation switching period
    - SNR of the SSB associated with the spatial relation ≥ -3 dB

Otherwise, the spatial relation is unknown.

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation no later than slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ 1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1 where $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [8].

If the target spatial relation associated to DL RS is unknown and UE is configured with uplink resources for transmission on target spatial relation, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation no later than slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $T_{L1\text{-}RSRP}$+1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [8],
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
  - $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ for SSB as specified in clause 9.5B,
    - with the assumption of M = 1
    - with $T_{Report}$ = 0
  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ for CSI-RS as specified in clause 9.5.4.2
    - configured with higher layer parameter *repetition* set to ON
    - with the assumption of M = 1 for periodic CSI-RS
    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
    - with $_{T}$Report = 0

The UE shall be able to transmit with the old UL spatial relation until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$.

When the UL spatial relation info switch for PUCCH changes both the associated DL RS and *pucch-PathlossReferenceRS* with the same MAC-CE activation, and if both the DL RS and *pucch-PathlossReferenceRS* are known as specified in clauses 8.12A.2 and 8.14.2 respectively, the UE shall be able to transmit PUCCH with the target UL spatial relation after the delay specified in clause 8.14.3. If either the associated DL RS or *pucch-PathlossReferenceRS* are unknown, a longer switching delay is allowed. The UE is not required to transmit PUCCH with the target UL spatial relation until the DL RS and pathloss reference RS switch are completed.

The normative reference for this requirement is TS 38.133 [6] clauses 8.12A.2 and 8.12A.3.

## 17.5.5.2 RRC based spatial relation switch for RedCap

### 17.5.5.2.0 Minimum conformance requirements RRC based uplink spatial relation switch delay

The spatial relation associated to DL RS is known if the following conditions are met:

- During the period from the last transmission of the DL RS resource used for the L1-RSRP measurement reporting for the target spatial relation to the completion of active spatial relation, where the DL RS resource for

L1-RSRP measurement is the DL RS in target spatial relation or QCLed to the target spatial relation with QCL type-D.

- Spatial relation switch command is received within 1280 ms upon the last transmission of the DL RS resource for beam reporting or measurement
- The UE has sent at least 1 L1-RSRP report for the target spatial relation before the spatial relation switch command
- The DL RS configured in spatial relation remains detectable during the spatial relation switching period
  - SNR of the DL RS configured in spatial relation ≥ -3 dB
- The SSB associated with the spatial relation remain detectable during the spatial relation switching period
  - SNR of the SSB associated with the spatial relation ≥ -3 dB

Otherwise, the spatial relation is unknown.

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured no later than slot n+ $T_{RRC_processing}$ /*NR slot length* +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [29] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [13].

If the target spatial relation associated to DL RS is unknown and UE is configured with uplink resources for transmission on target spatial relation, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured no later than slot n+ $T_{RRC_processing}$ /*NR slot length* + $T_{L1\text{-}RSRP}$ +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [29] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [13].
- $T_{L1\text{-}RSRP}$ is defined in clause 8.12A.3

For RedCap UE in HD-FDD mode, if a downlink reception overlaps with target periodic SRS with spatial relation of the serving cell with periodic SRS with spatial relation reconfigured then the UE is allowed to postpone the uplink transmission.

The normative reference for this requirement is TS 38.133 [6] clauses 8.12A.2 and 8.12A.5.

### 17.5.6.1 NR SA FR2 UE specific CBW change on PCell for 2 Rx UE

#### 17.5.6.1.1 Test purpose

To verify the UE specific CBW change delay requirement defined in TS 38.133 [6] clause 8.13A.

#### 17.5.6.1.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards.

#### 17.5.6.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.6.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.5.6.1.

#### 17.5.6.1.4 Test description

The test scenario comprises of one Cell, PCell (Cell 1), which has constant signal levels throughout the test. The test consists of 1 time period with duration of T1.

During T1 the TE sends an *RRCReconfiguration* message containing *SCS-SpecificCarrier* to reconfigure UE-specific CBW. The test equipment verifies the UE specific CBW switching delay in PCell by estimating the time from the moment the *RRCReconfiguration* message including updated UE-specific CBW configuration is sent to the moment a valid ACK/NACK is received.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. UE has been configured with UE specific CBW (CBW-1), initial BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.
2. The SS starts sending PDCCHs indicating new transmissions continuously on Cell 1.
3. The SS sends an *RRCReconfiguration* message containing *SCS-SpecificCarrier* with updated UE specific CBW (CBW-2), dedicated BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.
4. T1 starts from the beginning of the last slot (denoted as slot #i) carrying the PDSCH containing the *RRCReconfiguration* message in step 3.

5 If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot i + $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ , then the number of successful tests is increased by one.
Otherwise, the number of failure tests is increased by one.

6. After the SS receives the ACK/NACK in step 5 or when T1 expires, the SS shall

   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.

7. Depending on the choice in step 6, the SS shall,

   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 6. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 6.

8. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. UE has been configured with UE specific CBW (CBW-1), initial BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.

9. Repeat steps 2-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

# 17.6 Measurement procedures for RedCap

## 17.6.1 Intra-frequency measurements for RedCap

### 17.6.1.0 Minimum conformance requirements

#### 17.6.1.0.1 General

A measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the reference SSB of the serving cell and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same. The reference SSB is the SSB defined in BWP-specific *servingCellMO* under *BWP-DownlinkDedicated* of active DL BWP. If the field is absent, the reference SSB is the SSB defined in *servingCellMO* under *ServingCellConfig*.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP as specified in 3GPP TS 38.213 [8].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in TS 38.133 [6] clause 9.2B.5.3.

SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range 1.

The requirements in this clause apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap:
  - SS-RSRP related side conditions given in TS 38.133 [6] clauses 10.1.2 and 10.1.3 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in TS 38.133 [6] clauses 10.1.7 and 10.1.8 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in TS 38.133 [6] clauses 10.1.12 and 10.1.13 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.

For 2 Rx RedCap: The requirements in TS 38.133 [6] clause 9.2.4.3 shall apply.

The UE shall not send any event triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ without\ index_RedCap}$ defined in clause 17.6.1.0.2 or clause 17.6.1.0.3. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index_RedCap}$ as defined in clause 17.6.1.0.2 or clause 17.6.1.0.3. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index_RedCap}$ defined in clause 17.6.1.0.2 or clause 17.6.1.0.3 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [7]. When L3 filtering is used, an additional delay can be expected.

The normative reference for this requirement is TS 38.133 [6] clauses 9.2B.1 and 9.2B.4.3.

### 17.6.1.0.2 Minimum conformance requirements for event-triggered measurement without gap

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR2.

$$T_{identify_intra_without_index_RedCap} = (T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in Table 17.6.1.0.2-1.

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in Table 17.6.1.0.2-2.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non-overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

if the high layer in TS 38.331 [13] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

For 2 Rx RedCap:

$M_{pss/sss_sync_w/o_gaps_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_w/o_gaps_RedCap}$ = 40. For a UE supporting power class 2, $M_{pss/sss_sync_w/o_gaps_RedCap}$ = 24. For a UE supporting FR2 power class 3, $M_{pss/sss_sync_w/o_gaps_RedCap}$ = 24. For a UE supporting FR2 power class 4, $M_{pss/sss_sync_w/o_gaps_RedCap}$ = 24. For a UE supporting FR2 power class 7, $M_{pss/sss_sync_w/o_gaps_RedCap}$ = 24.

$M_{meas_period_w/o_gaps_RedCap}$: For a UE supporting power class 1 or 5, $M_{meas_period_w/o_gaps_RedCap}$ = 40. For a UE supporting FR2 power class 2, $M_{meas_period_w/o_gaps_RedCap}$ = 24. For a UE supporting power class 3, $M_{meas_period_w/o_gaps_RedCap}$ = 24. For a UE supporting power class 4, $M_{meas_period_w/o_gaps_RedCap}$ = 24. For a UE supporting power class 7, $M_{meas_period_w/o_gaps_RedCap}$ = 24.

When intra-frequency SMTC is fully non-overlapping with measurement gaps or intra-frequency SMTC is fully overlapping with MGs, Kp = 1.

When intra-frequency SMTC is partially overlapping with measurement gaps, Kp = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. For calculation of Kp, if the high layer signalling (TS 38.331 [13]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

If the higher layer signalling in TS 38.331 [13] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index_RedCap}$.

For FR2,

$K_{layer1_measurement}$ = 1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or

- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$ = 1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

If the higher layer signalling in TS 38.331 [13] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra_RedCap}$.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 intra-frequency cell

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration (The signalling *deriveSSB_IndexFromCell* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [13], the SMTC periodicity follows *smtc2*; otherwise the SMTC periodicity follows *smtc1*.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration (The signalling *deriveSSB_IndexFromCellc* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [13], the SMTC periodicity follows *smtc2*; otherwise the SMTC periodicity follows *smtc1*.

If following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots.

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE is expected to receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE is expected to receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

The normative reference for this requirement is TS 38.133 [6] clauses 9.2B.5.

### 17.6.1.0.3 Minimum conformance requirements for event-triggered measurement with gap

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR2.

$$T_{identify_intra_without_index_RedCap} = T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap} \text{ ms}$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in Table 17.6.1.0.3-1.

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in Table 17.6.1.0.3-2.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.2 for measurement conducted within measurement gaps.

For 2 Rx RedCap:

$M_{pss/sss_sync_with_gaps_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync\ with_gaps_RedCap} = 40$. For a UE supporting FR2 power class 2, $M_{pss/sss_sync\ with_gaps_RedCap} = 24$. For a UE supporting FR2 power class 3, $M_{pss/sss_sync\ with_gaps_RedCap} = 24$. For a UE supporting power class 4, $M_{pss/sss_sync\ with_gaps_RedCap} = 24$. For a UE supporting FR2 power class 7, $M_{pss/sss_sync\ with_gaps_RedCap} = 24$.

$M_{meas_period_with_gaps_RedCap}$: For a UE supporting power class 1 or 5, $M_{meas_period_with_gaps_RedCap} = 40$. For a UE supporting power class 2, $M_{meas_period_with_gaps_RedCap} = 24$. For a UE supporting power class 3, $M_{meas_period_with_gaps_RedCap} = 24$. For a UE supporting power class 4, $M_{meas_period\ with_gaps_RedCap} = 24$. For a UE supporting power class 7, $M_{meas_period_with_gaps_RedCap} = 24$.

If the higher layer signalling in TS 38.331 [13] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index_RedCap}$ or $T_{identify_intra_with_index_RedCap.}$

#### 17.6.1.3.4.2 Test procedure

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

There are two BWPs configured in Cell 1, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 1. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to T1 in Table 17.6.1.3.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message to configure RedCap-specific dedicated BWP and Event A3 triggered reporting.

5. The UE shall transmit an *RRCReconfigurationComplete* message. T1 starts upon the SS receives the *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 17.6.1.3.5-1. T2 starts.

7. The SS increases the number of successful tests by one if the UE transmits a *MeasurementReport* message triggered by event A3 satisfying the overall delay requirement specified in clause 17.6.1.3.5, otherwise the SS increases the number of failure tests by one.

8. After the SS receive the *MeasurementReport* message in step 7) or when T2 expires, the SS shall:

   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.

9. Depending on the choice in step 8, the SS shall,

   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 8. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 8.

10. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

11. Repeat steps 2-10 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

| Time multiplexing of the downlink transmissions from each AoA | | | Defined in Figure 17.6.1.3.5-1 | | | |

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: Information about types of UE beam is given in TS 38.133 [6] clause B.2.1.3 and does not limit UE implementation or test system implementation.

Note 5: Calculation of $Es/Iot_{BB}$ includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor $\Delta MB_P$ from TS 38.101-2 [3] Table 6.2.1.3-4.

The overall delay is measured from the beginning of time period T2 to the time that the SS receives the first *MeasurementReport* message triggered by event A3. It is allowed to be up to 2 x $TTI_{DCCH}$ higher than the measurement reporting delay specified in TS 38.133 [6] clause 9.2B.4 due to the TTI insertion uncertainty of the measurement report in DCCH.

Then the overall delay shall be no larger than: $T_{identify_intra_without_index}$ + 2 x $TTI_{DCCH}$, where

- $T_{identify_intra_without_index}$ = 3200 ms for UE supporting power class 1 or 5 and 1920 ms for UE supporting power class 2, 3, 4 or 7, is the time for intra-frequency cell identification specified in TS 38.133 [6] clause 9.2B.5.1,
- $TTI_{DCCH}$ = 1 ms.

Which gives a total of 3202 ms for UE supporting power class 1 or 5 and 1922 ms for UE supporting power class 2, 3, 4 or 7.

The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

## 17.6.2 Inter-frequency measurements for RedCap

### 17.6.2.0 Minimum conformance requirements

The requirements in clause 17.6.2.0 apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap UE:
  - SS-RSRP related side conditions given in TS 38.133 [6] clauses 10.1.4 and 10.1.5 for FR1 and FR2, respectively, for a corresponding band,

- SS-RSRQ related side conditions given in TS 38.133 [6] clauses 10.1.9 and 10.1.10 for FR1 and FR2, respectively, for a corresponding band,
- SS-SINR related side conditions given in TS 38.133 [6] clauses 10.1.14 and 10.1.15 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to TS 38.133 [6] Annex B.2.3 for a corresponding band.

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index_RedCap}$.

$$T_{identify_inter_without_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap}) \text{ ms}$$

$$T_{identify_inter_with_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap} + T_{SSB_time_index_inter_RedCap}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_inter_RedCap}$: it is the time period used in PSS/SSS detection given in table 17.6.2.0-1.

$T_{SSB_time_index_inter_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in table 17.6.2.0-2.

$T_{SSB_measurement_period_inter_RedCap}$: equal to a measurement period of SSB based measurement given in table , table 17.6.2.0-3, table.

For 2 Rx RedCap UE:

$M_{pss/sss_sync_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_inter_RedCap}$ = 64 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{pss/sss_sync_inter_RedCap}$ = 40 samples.

$M_{SSB_index_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{SSB_index_inter_RedCap}$ = 40 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{SSB_index_inter_RedCap}$ = 24 samples.

$M_{meas_period_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter_RedCap}$ = 64 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{meas_period_inter_RedCap}$ = 40 samples.

$CSSF_{inter_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.2 for measurement conducted within measurement gaps.

| DRX cycle > 320 ms | $M_{SSB_index_inter_RedCap} \times \text{DRX cycle} \times CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non-DRX requirements apply according to the conditions described in clause 3.6.1. | |

When measurement gaps are provided for inter-frequency measurements, the RedCap UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as

specified in TS 38.133 [6] clauses 10.1A.4, 10.1A.5, 10.1A.8, 10.1A.9, 10.1A.12 and 10.1A.13, respectively, as shown in table 17.6.2.0-3.

**Table 17.6.2.0-3: Measurement period for inter-frequency measurements with gaps (Frequency FR2) for 2 Rx RedCap UE**

| Condition NOTE1 | $T_{SSB_measurement_period_inter_RedCap}$ |
|---|---|
| No DRX | $\max(400\text{ ms}, M_{meas_period_inter_RedCap} \times \max(\text{MGRP}, \text{SMTC period})) \times CSSF_{inter_RedCap}$ |
| DRX cycle ≤ 320 ms | $\max(400\text{ ms}, (1.5 \times M_{meas_period_inter_RedCap}) \times \max(\text{MGRP}, \text{SMTC period}, \text{DRX cycle})) \times CSSF_{inter_RedCap}$ |
| DRX cycle > 320 ms | $M_{meas_period_inter_RedCap} \times \text{DRX cycle} \times CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non-DRX requirements apply according to the conditions described in clause 3.6.1. | |

For 2 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. Both $T_{identify_inter_without_index_RedCap}$ and $T_{identify_inter_with_index_RedCap}$ are defined in TS 38.133 [6] clause 9.3B.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_inter_without_index_RedCap}$ or $T_{identify_inter_with_index_RedCap}$ as defined in TS 38.133 [6] clauses 9.3B.4 or 9.3B.7.1. If a cell which has been detectable at least for the time period $T_{identify\ inter\ without\ index_RedCap}$ or $T_{identify\ inter\ with\ index_RedCap}$ defined in TS 38.133 [6] clauses 9.3B.4 or 9.3B.7.1 becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ $T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [7]. When L3 filtering is used, an additional delay can be expected.

The normative reference for this requirement is TS 38.133 [6] clauses 9.3B.2, 9.3B.4, 9.3B.5 and 9.3B.6.3.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
Note 3: SSB_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

## 17.6.4 NR Measurements with autonomous gaps for RedCap

### 17.6.4.0 Minimum conformance requirements

#### 17.6.4.0.1 Minimum conformance requirements for CGI identification of an NR cell with autonomous gaps

The UE shall identify and report the CGI of a known NR target cell when requested by the network for the purpose of *reportCGI*. Only one cell is provided to the UE with *cellForWhichToReportCGI* for identifying the CGI.The UE may make autonomous gaps in both downlink reception and uplink transmission for receiving *MIB* and *SIB1* message according to clause 5.5.3 of TS 38.331 [13]. Note that a UE is not required to use autonomous gap if *useAutonomousGaps* is set to false. If autonomous gaps are used for measurement with the purpose of *reportCGI*, regardless of whether DRX is used or not, the UE shall be able to identify a new CGI of NR cell within:

$$T_{identify_CGI_redcap} = (T_{MIB_redcap} + T_{SIB1_redcap})\ ms$$

Where:

$T_{MIB_redcap}$ is the time period used to acquire *MIB* message. $T_{MIB_redcap} = 25 * T_{SMTC}$ ms for target cell carrier frequency on FR2.

$T_{SIB1_redcap}$ is the time period used to acquire *SIB1* message. $T_{SIB1_redcap} = 6 * T_{RMSI\text{-}scheduling}$ ms.

Where $T_{SMTC}$ is the SMTC periodicity configured for the target cell measurement, and $T_{RMSI\text{-}scheduling}$ is

- the periodicity with which the *SIB1* is actually transmitted by the NR target cell when SSB and RMSI CORESET multiplexing pattern is 1.

- the maximum between the periodicity with which the *SIB1* is actually transmitted by the NR target cell and $T_{SMTC}$ when SSB and RMSI CORESET multiplexing pattern is 2 or 3. The requirement for identifying the CGI of an NR cell within $T_{identify_CGI_redcap}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [13] is used.

In the requirement a cell is known if,

- During the last 5 seconds for FR1 or 3 seconds for FR2 before the reception of the report CGI command:
  - The UE has sent a valid L3-RSRP measurement report with SSB index for the target cell and.
- During *MIB* decoding at least reported SSBs remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133 [6], and
- During *SIB1* decoding the SSB used for *MIB* decoding remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133 [6], and
- During *MIB* decoding, the SSB for *MIB* decoding remains detectable with SNR $\geqslant$-3 dB
- During *SIB1* decoding, the PDSCH for *SIB1* decoding remains detectable with SNR $\geqslant$-3 dB

The CGI reporting delay is defined as the time between a command that will trigger a CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay

uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI_redcap}$ plus RRC procedure delay defined in clause 12 in TS 38.331 [13], and additional 20 ms margin if target cell is on FR2.

When a RedCap UE is identifying CGI of an NR cell with autonomous gaps, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on PCell for the following slots:

- with up to K1 interruptions with interrupted slots up to X1 specified in Table 17.6.4.0.1-1 for each interruption during *MIB* decoding time period $T_{MIB_redcap}$ (ms).
- with up to L1 interruptions with interrupted slots up to Y1 specified in Table 17.6.4.0.1-1 during *SIB1* decoding time period $T_{SIB1_redcap}$ (ms) for SSB and CORESET for RMSI scheduling multiplexing patterns 1.
- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in Table 17.6.4.0.1-1 during *SIB1* decoding time period $T_{SIB1_redcap}$ (ms) for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 25 for the target cell carrier frequency on FR2, and
- L1 = $T_{SIB1_redcap}$ /20 and
- L2 = $T_{SIB1_redcap}$ /$T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 17.6.4.0.1-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 3 | 0.125 | 48 | 49 | 37 |

|---|---|---|
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. | | |
| Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | |
| Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port. | | |
| Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone. | | |
| Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone. | | |
| Note 7: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3, and does not limit UE implementation or test system implementation. | | |

The UE shall transmit a measurement report containing the cell global identifier of Cell 2 within overall delay from the start of T2, where the overall delay is calculated as follows,

Overall delay = RRC procedure delay + $T_{identify_CGI_RedCap}$ + additional margin for FR2 + TTI insertion uncertainty

- RRC procedure delay = 10 ms, is the RRC procedure delay specified in TS 38.331 [13] clause 12;
- $T_{identify_CGI_RedCap} = T_{MIB_redcap} + T_{SIB1_redcap}$
  - $T_{MIB_redcap}$ = 500 ms, is the time period used to acquire *MIB* message;
  - $T_{SIB1_redcap}$ = 120 ms, is the time period used to acquire *SIB1* message;
- TTI insertion uncertainty = 2 x $TTI_{DCCH}$ = 2 ms, is the delay uncertainty when inserting the measurement report to the TTI of the uplink DCCH;
- additional margin for FR2 = 20 ms, is specified in TS 38.133 [6] clause 9.11A.3

Which gives overall delay = 10 + 500 + 120 + 20 + 2 = 652 ms, allow 655 ms.

From the start of T2 until 655 ms. The number of missed ACK/NACK shall be no more than the maximum number of missed ACK/NACK given in Table 17.6.4.1.5-2.

The rate of correct events observed during repeated tests shall be at least 90%.

**Table 17.6.4.1.5-2: Maximum number of missed ACK/NACKs during the overall delay**

| Test config. | Maximum number of missed ACK/NACKs |
|---|---|
| 1 | 1240 Note 1 |
| NOTE 1: The overall missed ACK/NACK number is caused by two parts. Firstly, up to 25 interruptions, each has a length of up to 48 slots, are allowed during $T_{MIB_redcap}$ as specified in TS 38.133 [6] Table 9.11A.4-1. Secondly, up to 6 interruptions, each has a length of up to 49 slots are allowed during $T_{SIB1_redcap}$ as specified in TS 38.133 [6] Table 9.11A.4-1 assuming SSB/CORESET0 multiplxing pattern #0. In worst case, they will cause up to ceil(48/5)*4*25 + ceil(49/5)*4*6 = 1240 missed ACK/NACKs (assuming TDDConf.3.1 is used). | |
