Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: Subtest 1 is not used when testing with 30 kHz SSB SCS.

Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 7: Δ_{BG_offset} is defined in clause 3A.4, Table 3A.4.1-2.

16.7.1.2.2 NR SA FR1 SS-RSRP relative measurement accuracy for 2 Rx UE

16.7.1.2.2.1 Test purpose

The purpose of this test is to verify that the intra-frequency SS-RSRP relative measurement accuracy is within the specified limits for all bands.

16.7.1.2.2.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

16.7.1.2.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.1.2.

16.7.1.3.2 NR SA FR1-FR1 SS-RSRP relative measurement accuracy for 1 Rx UE

16.7.1.3.2.1 Test purpose

The purpose of this test is to verify that the inter-frequency SS-RSRP relative measurement accuracy is within the specified limits for all bands.

16.7.1.3.2.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

16.7.1.3.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.1.0.4.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.1.3.

16.7.2 SS-RSRQ for RedCap

16.7.2.0 Minimum conformance requirements

16.7.2.0.1 Intra-frequency SS-RSRQ measurement accuracy requirements

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 4.7.2.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the absolute accuracy requirements in Table 16.7.2.0.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [2] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to TS 38.133 [6] Annex B.2.15 for a corresponding band for each relevant SSB.

The normative reference for this requirement is TS 38.133 [6] clauses 10.1A.6.1.1.

16.7.2.0.2 Inter-frequency SS-RSRQ absolute measurement accuracy requirements

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 4.7.2.0.2 shall apply.

When RedCap UE is only required to support 1 Rx, the absolute accuracy requirements in Table 16.7.2.0.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [2] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to TS 38.133 [6] Annex B.2.16 for a corresponding band for each relevant SSB.

16.7.2.0.3 Inter-frequency SS-RSRQ relative measurement accuracy requirements

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 4.7.2.0.3 shall apply.

When RedCap UE is only required to support 1 Rx, the relative accuracy requirements in Table 16.7.2.0.3-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [2] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to TS 38.133 [6] Annex B.2.3 for a corresponding band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

16.7.2.1 NR SA FR1 SS-RSRQ absolute measurement accuracy for 1 Rx UE

16.7.2.1.1 Test purpose

The purpose of this test is to verify that the intra-frequency SS-RSRQ absolute measurement accuracy is within the specified limits for all bands.

16.7.2.1.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

16.7.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.2.1.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRQ, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.

Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 7: Subtest 2 is not used when testing with 30 kHz SSB SCS.

16.7.2.3 Inter-frequency measurement accuracy for 1 Rx UE

16.7.2.3.1 NR SA FR1-FR1 SS-RSRQ absolute measurement accuracy for 1 Rx UE

16.7.2.3.1.1 Test purpose

To verify that the inter-frequency SS-RSRQ absolute measurement accuracy is within the specified limits for all bands. This test will verify the requirements in TS 38.133 [6] clause 10.1A.8.1.1.

16.7.2.3.1.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

16.7.2.3.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.2.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.2.3.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRQ, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.
Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

16.7.2.4.2 NR SA FR1-FR1 SS-RSRQ relative measurement accuracy for 2 Rx UE

16.7.2.4.2.1 Test purpose

To verify that the inter-frequency SS-RSRQ relative measurement accuracy is within the specified limits for all bands. This test will verify the requirements in TS 38.133 [6] clause 10.1A.8.1.2.

16.7.2.4.2.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards.

16.7.2.4.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.2.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.2.4.

16.7.3 SS-SINR for RedCap

16.7.3.0 Minimum conformance requirements

16.7.3.0.1 Intra-frequency SS-SINR measurement accuracy requirements

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 4.7.3.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the absolute accuracy requirements in Table 16.7.3.0.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [2] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to TS 38.133 [6] Annex B.2.15 for a corresponding band for each relevant SSB.

16.7.3.0.3 Inter-frequency SS-SINR relative measurement accuracy requirements

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 4.7.3.0.3 shall apply.

When RedCap UE is only required to support 1 Rx, the relative accuracy requirements in Table 16.7.3.0.3-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [2] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to TS 38.133 [6] Annex B.2.16 for a corresponding band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-SINR, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-SINR, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.
Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

16.7.3.3.1 NR SA FR1-FR1 SS-SINR absolute measurement accuracy for 1 Rx UE

16.7.3.3.1.1 Test purpose

To verify that the inter-frequency SS-SINR absolute measurement accuracy is within the specified limits for all bands. This test will verify the requirements in TS 38.133 [6] clause 10.1A.12.1.1.

16.7.3.3.1.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards and supporting SS-SINR measurement.

16.7.3.3.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.3.0.2.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-SINR, SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-SINR, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: NR operating band groups are as defined in TS 38.133 [6] clause 3.5.2.
Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

16.7.3.4.2 NR SA FR1-FR1 SS-SINR relative measurement accuracy for 2 Rx UE

16.7.3.4.2.1 Test purpose

To verify that the inter-frequency SS-SINR relative measurement accuracy is within the specified limits for all bands. This test will verify the requirements in TS 38.133 [6] clause 10.1A.12.1.2.

16.7.3.4.2.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards and supporting SS-SINR measurement.

16.7.3.4.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.3.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.3.4.

16.7.4 L1-RSRP measurement for beam reporting for RedCap

16.7.4.0 Minimum conformance requirements

16.7.4.0.1 SSB based absolute L1-RSRP measurement accuracy requirements

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 4.7.4.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the absolute accuracy requirements in Table 16.7.4.0.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [2] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to TS 38.133 [6] Annex B.4.1 for a corresponding band for each relevant SSB.

Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4:	RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5:	The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

16.7.4.3.2 NR SA FR1 CSI-RS based L1-RSRP relative measurement accuracy for 1 Rx UE

16.7.4.3.2.1 Test purpose

To verify that the CSI-RS based L1-RSRP relative measurement accuracy is within the specified limits for all bands.

16.7.4.3.2.2 Test applicability

This test applies to all types of NR RedCap UE with 1 Rx from Release 17 onwards.

16.7.4.3.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.4.0.4.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.4.3.

16.7.5 E-UTRAN RSRP for RedCap

16.7.5.0 Minimum conformance requirements

16.7.5.0.1 E-UTRAN RSRP absolute accuracy

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 6.7.5.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the requirements for absolute accuracy of RSRP in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 16.7.5.0.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [27] Clause 7.3 for reference sensitivity are fulfilled.

RSRP|dBm according to TS 36.133 [23] Annex B.3.3 for a corresponding band.

16.7.6 E-UTRAN RSRQ for RedCap

16.7.6.0 Minimum conformance requirements

16.7.6.0.1 E-UTRAN RSRQ absolute accuracy

When RedCap UE is capable of 2 Rx, the minimum requirements given in clause 6.7.6.0.1 shall apply.

When RedCap UE is only required to support 1 Rx, the requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 16.7.6.0.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [27] Clause 7.3 for reference sensitivity are fulfilled.

RSRP|dBm according to TS 36.133 [23] Annex B.3.1 for a corresponding band.

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The condition level is increased by $\Delta > 0$, when applicable, as described in TS 36.133 [23] clauses B.4.2 and B.4.3.
NOTE 4: E-UTRA operating band groups are as defined in TS 36.133 [23] clause 3.5.

The reporting range and mapping specified for RSRP measurements in clause 9.1.4 of TS 36.133 [23] shall apply.

The normative reference for this requirement is TS 38.133 [6] clauses 10.2A.3 and TS 36.133 [23] clause 9.1.5.5.

16.7.6.1 NR SA FR1 - E-UTRA RSRQ absolute measurement accuracy for 1 Rx UE

16.7.6.1.1 Test purpose

To verify that the E-UTRAN RSRQ measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clause 10.2A.2 for SA inter-RAT E-UTRAN RSRP measurements.

16.7.6.1.2 Test applicability

This test applies to all types of NR RedCap UEs with 1 Rx from Release 17 onwards and supporting E-UTRA.

16.7.6.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 16.7.6.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.16.7.6.1.

17 NR standalone tests in FR2 for RedCap

17.1 RRC_IDLE state mobility for RedCap

17.1.1 NR cell re-selection for RedCap

17.1.1.0 Minimum conformance requirements

17.1.1.0.1 Minimum conformance requirements for intra-frequency cell re-selection for RedCap

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the re-selection criteria defined in TS 38.304 [30] within $T_{detect,NR_Intra_RedCap}$ when that Treselection = 0. An intra-frequency cell is considered to be detectable according to the conditions defined in TS 38.133 [6] Annex B.1.4 for a corresponding band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra_RedCap}$ for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra_RedCap}/2$.

The UE shall not consider a NR neighbour cell in cell re-selection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met re-selection criterion defined in TS 38.304 [30] within $T_{evaluate,NR_Intra_RedCap}$ when $T_{reselection} = 0$ provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 4.5 dB better ranked in FR2 for 2 Rx RedCap.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [30] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them.
        - the cell is at least 4.5 dB better ranked in FR2 if the current serving cell is among them for 2 Rx RedCap.

When evaluating cells for re selection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the intra-frequency cell is satisfied with the re-selection criteria which are defined in TS 38.304 [30], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the re-selection criteria within this duration, then the UE shall reselect that cell.

For 2 Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in Table 17.1.1.0.1-1.

For 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in Table 17.1.1.0.1-2 for FR2, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and is the same in all PTWs during any of $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ when multiple PTWs are used.

Note 2: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2 = 1. If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer $T_{detect, NR_intra_RedCap}$ is expected.

	2.56	≥15.36 (12)	3		2.56 x N1 (1 x N1)	5.12 x N1 (2 x N1)

NOTE 1: Applies for RedCap UE of all power class.
NOTE 2: The number of DRX cycles in this table is given for the DRX cycles within PTWs.
NOTE 3: The eDRX_IDLE cycle lengths are as specified in clause 10.5.5.32 of TS 24.008 [34].
NOTE 4: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s and 10.24 s. Otherwise, number of DRX cycles.
NOTE 5: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Intra_RedCap * DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 6: When eDRX = 20.48 s and DRX = 0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, being configured with eDRX_IDLE cycle, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

17.1.1.0.2 Minimum conformance requirements for inter-frequency cell re-selection for RedCap

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in TS 38.133 [6] in clause 4.2.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible re-selection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the re-selection criteria defined in TS 38.304 [30] within $K_{carrier_RedCap} * T_{detect,NR_Inter_RedCap}$ if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection} = 0$ provided that the re-selection criteria is met

For 2 Rx RedCap by a margin of at least

5 dB in FR1 or 6.5 dB in FR2 for re-selections based on ranking or

7.5 dB in FR2 for SS-RSRP re-selections based on absolute priorities or

4 dB in FR2 for SS-RSRQ re-selections based on absolute priorities

The parameter $K_{carrier_RedCap}$ is the number of NR inter-frequency carriers indicated by the serving cell. An inter-frequency cell is considered to be detectable according to the conditions defined in TS 38.133 [6] in Annex B.1.5 for a corresponding band. When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter_RedCap}$. If, after detecting a cell in a higher priority search, it is determined that re-selection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of re-selection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier_RedCap} * T_{measure,NR_Inter_RedCap}$ for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell re-selection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met re-selection criterion defined TS 38.304 [30] within $K_{carrier} * T_{evaluate,NR_Inter_RedCap}$ when $T_{reselection} = 0$ provided that the re-selection criteria is met by

- the condition when performing equal priority re-selection and
  - when *rangeToBestCell* is not configured:
    - the cell is at least 6.5 dB better ranked in FR2 for 2 Rx RedCap.
  - when *rangeToBestCell* is configured:
    - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value defined in TS 38.304 [30] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
      - if there are multiple such cells, the cell has the highest rank among them
      - the cell is at least 6.5 dB better ranked in FR2 if the current serving cell is among them, or 7.5 dB in FR2 for SS-RSRP re-selections based on absolute priorities for 2 Rx RedCap or 4 dB in FR2 for SS-RSRQ re-selections based on absolute priorities for 2 Rx RedCap.

When evaluating cells for re-selection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the re-selection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the re-selection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle = 320 ms defined in TS 38.133 [6] in Table 17.1.1.0.2-1 for 2 Rx RedCap under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where T_{SMTC_intra} and T_{SMTC_inter} are periodicities of the SMTC occasions configured for the intra-frequency carrier and the inter-frequency carrier respectively, and
- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion defined in TS 38.304 [30].

For Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in Table 17.1.1.0.2-1.

For 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in Table 17.1.1.0.2-2 for FR2. The requirements apply provided that the serving cell is configured with eDRX_IDLE and is the same in all PTWs during any of $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ when multiple PTWs are used.

NOTE 3: The eDRX_IDLE cycle lengths are as specified in clause 10.5.5.32 of TS 24.008 [34].
NOTE 4: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s and 10.24 s. Otherwise, number of DRX cycles.
NOTE 5: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Inter_RedCap * DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 6: When eDRX = 20.48 s and DRX = 0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, being configured with eDRX_IDLE cycle, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

17.1.1.0.3 Minimum conformance requirements for intra-frequency cell re-selection for RedCap UE configured with stationary relaxed measurement criterion

This clause contains requirements for measurements on intra-frequency NR cells provided that:

- UE is configured with *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and UE has fulfilled that criterion, or
- UE is configured with both *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and *cellEdgeEvaluationWhileStationary* defined in TS 38.331 [13] criterion and *combineRelaxedMeasCondition2* defined in TS 38.331 [13] not configured, and UE has fulfilled only the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion

The requirements defined in clause 17.1.1.0.3 apply for this clause except that:

- $T_{detect,NR_Intra_RedCap_Relax}$ as specified in Table 17.1.1.0.3-1 for 2 Rx RedCap.
- $T_{measure,NR_Intra_RedCap_Relax}$ as specified in Table 17.1.1.0.3-1 for 2 Rx RedCap.
- $T_{evaluate,NR_Intra_RedCap_Relax}$ as specified in Table 17.1.1.0.3-1 for 2 Rx RedCap.

If the UE is configured with eDRX_IDLE cycle then the requirements in Table 17.1.1.0.3-2 are applicable for eDRX cycle up to 10.24 s in FR2.

If the UE is configured with eDRX_IDLE cycle greater than 10.24 s in FR2, then the requirements in Table 17.1.1.0.3-3 apply provided eDRX cycle is ≤ 163.84 sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW window length.

Note 1: Applies for RedCap UE of all supporting FR2 power classes.
Note 2: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2 = 1. If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.
Note 3: K3 = 6 is the measurement relaxation factor applicable for UE fulfilling the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion.

Note 2: The number of DRX cycles in this table is given for the DRX cycles within PTWs.
Note 3: The eDRX_IDLE cycle lengths are as specified in clause 10.5.5.32 of TS 24.008 [34].
Note 4: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Intra_RedCap_Relax * DRX_cycle}{1.28} \right\rceil * 1.28$.
Note 5: The measurement shall not be performed across PTW's. In this case the measurement is performed in the next available PTW.
Note 6: The evaluation shall not be performed across PTW's. In this case the evaluation is performed in the next available PTW.
Note 7: For DRX cycle length is 0.32 s, 0.64 s, and 2.56 s, K3 = 6 is the measurement relaxation factor applicable for UE fulfilling the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion. For DRX cycle length is 1.28 s, K3 = 4 is the measurement relaxation factor applicable for UE fulfilling the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion.

17.1.1.0.4 Minimum conformance requirements for inter-frequency cell re-selection for RedCap UE configured with stationary relaxed measurement criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- UE is configured with *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and UE has fulfilled that criterion, or

- UE is configured with both *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion and *cellEdgeEvaluationWhileStationary* defined in TS 38.331 [13] criterion and *combineRelaxedMeasCondition2* defined in TS 38.331 [13] not configured, and UE has fulfilled only the *stationaryMobilityEvaluation* defined in TS 38.331 [13] criterion, and

The requirements defined in clause17.1.1.0.4 apply for this clause except that:

- $T_{detect,NR_Inter_RedCap_Relax}$ as specified in Table 17.1.1.0.4-1 for 2 Rx RedCap.
- $T_{measure,NR_Inter_RedCap_Relax}$ as specified in Table 17.1.1.0.4-1 for 2 Rx RedCap.
- $T_{evaluate,NR_Inter_RedCap_Relax}$ as specified in Table 17.1.1.0.4-1 and for 2 Rx RedCap.
- When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every K2*$T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in TS 38.133 [6] in clause 4.2.2.7 and, K2 = 240.

If the UE is configured with eDRX_IDLE cycle then the requirements in Table 17.1.1.0.4-2 are applicable for eDRX cycle up to 10.24 s in FR2.

If the UE is configured with eDRX_IDLE cycle greater than 10.24 s FR2, then the requirements in Table 17.1.1.0.4-3 apply provided that eDRX cycle is ≤ 163.84 sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW window length.

17.1.1.1 NR SA FR2 Cell reselection for 2 Rx UE

Editor's note: This test case is complete for the following configurations:

- Test frequency f ⩽ 40.8 GHz.
- UE PC3.
- This test case is incomplete for Test frequency f > 40.8 GHz.
- This test case is incomplete for UE power class other than PC3.

17.1.1.1.1 Test purpose

The purpose of this test is to verify the requirement for the NR SA intra-frequency cell reselection in FR2 for 2 Rx RedCap UEs. The requirements are specified in TS 38.133 [6] in clause 4.2B.2.3.

17.1.1.1.2 Test applicability

This test applies to all types of NR RedCap UE release 17 and forward.

17.1.1.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 17.1.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.1.1.1.

17.1.1.1.4 Test description

17.1.1.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 17.1.1.1.4.1-1.

17.1.1.1.4.2 Test procedure

Two cells are deployed in the test, which are one FR2 NR PCell (Cell 1) and an NR neighbour cell (Cell 2) on the same frequency. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

In the following test procedure "UE responds" means "UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1. Set Cell 2 physical cell identity = initial Cell 2 physical cell identity.

2. Set the parameters according to T1 in Table 17.1.1.1.5-1. T1 starts.

3. Set Cell 2 physical cell identity = ((current Cell 2 physical cell identity + 3) mod 1008) for one iteration of the test procedure loop.

4. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.1.5-1.

5. The SS waits for random access requests information from the UE to perform cell re-selection to a newly detectable cell, Cell 2.

6. If the UE responds on the newly detectable cell, Cell 2 during time duration T2 within 130 seconds from the beginning of time period T2, then count a success for the event "Re-select newly detected Cell 2". Otherwise, count a failure for the event "Re-select newly detected Cell 2".

7. If the UE has re-selected Cell 2 within T2, after the re-selection or when T2 expires, continue with step 8. Otherwise, if T2 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and skip to step 14.

8. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 2.

9. The SS shall switch the power setting from T2 to T3 as specified in Table 17.1.1.1.5-1.

10. The SS waits for random access requests information from the UE to perform cell re-selection to an already detected cell, Cell 1.

11. If the UE responds on the already detected cell, Cell 1 during time duration T3 within 27 seconds from the beginning of time period T3, then count a success for the event "Re-select already detected Cell 1". Otherwise, count a fail for the event "Re-select already detected Cell 1".

12. If the UE has re-selected Cell 1 within T3, after the re-selection or when T3 expires, continues with step 13. Otherwise, if T3 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 14.

13. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 1.

14. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

15. Repeat steps 2-14 until a test verdict has been achieved.
    Each of the events "Re-select newly detected Cell 2" and "Re-select already detected Cell 1" is evaluated independently for the statistic, resulting in an event verdict: pass or fail. Each event is evaluated only until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved. Different events may require different times for a verdict.
    If both events pass, the test passes. If one event fails, the test fails.

Note 6:	Including the test tolerance given in Annex F.

The cell re-selection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 130 s.

The cell re-selection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 27 s.

NOTE: The cell reselection delay to a newly detectable cell can be expressed as: $T_{detect, NR_Intra} + T_{SI\text{-}NR}$, and to an already detected cell can be expressed as: $T_{evaluate, NR_intra} + T_{SI\text{-}NR}$,

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

17.1.1.2 NR SA FR2-FR2 Cell reselection for 2 Rx UE

Editor's note: This test case is complete for the following configurations:

- Test frequency f ⩽ 40.8 GHz.
- UE PC3.
- This test case is incomplete for Test frequency f > 40.8 GHz.
- This test case is incomplete for UE power class other than PC3.

17.1.1.2.1 Test purpose

The purpose of this test is to verify the requirement for the NR SA inter-frequency cell reselection in FR2 for 2 Rx RedCap UEs. The requirements are specified in TS 38.133 [6] in clause 4.2B.2.4.

17.1.1.2.2 Test applicability

This test applies to all types of NR RedCap UE release 17 and forward.

17.1.1.2.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 17.1.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.17.1.1.2.

17.1.1.2.4.2 Test procedure

Two cells on two RF channels are deployed in the test, which are one FR2 NR PCell (Cell 2) on RF channel 1 and an NR neighbour cell (Cell 1) on RF channel 2. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 2 is already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 2. Set Cell 1 physical cell identity = initial Cell 1 physical cell identity.

2. Set the parameters according to T1 in Table 17.1.1.2.5-1. T1 starts.

3. The SS waits for random access requests information from the UE to perform cell re-selection on the lower priority cell, Cell 1.

4. If the UE responds on lower priority cell, Cell 1 during time duration T1 within 27 seconds from the beginning of time period T1, then count a success for the event “Re-select lower priority Cell 1”. Otherwise, count a fail for the event “Re-select lower priority Cell 1”.

5. If the UE has re-selected Cell 1 within T1, after the re-selection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 13.

6. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 1.

7. The SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.2.5-1. During time duration T2, Cell 2 shall be powered OFF and the physical cell identity = ((current Cell 2 physical cell identity + 1) mod 1008) shall be changed to ensure Cell 2 is not detected by the UE.

8. When T2 expires, the SS shall switch the power setting from T2 to T3 as specified in Table 17.1.1.2.5-1.

9. The SS waits for random access requests information from the UE to perform cell re-selection on the higher priority cell, Cell 2.

10. If the UE responds on higher priority cell, Cell 2 during time duration T3 within 87 seconds from the beginning of time period T3, then count a success for the event “Re-select higher priority Cell 2”. Otherwise, count a fail for the event “Re-select higher priority Cell 2”.

11. If the UE has re-selected Cell 2 within T3, after the re-selection or when T3 expires, continues with step 12. Otherwise, if T3 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and continue with step 13.

12. The SS shall send an *RRCRelease* message to ensure that the UE is in state RRC_IDLE on Cell 2.

13. Ensure the UE is in state RRC_IDLE with generic procedure parameters connectivity *NR*, connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5 on Cell 2.

14. Repeat steps 2-13 until a test verdict has been achieved.
    Each of the events “Re-select lower priority Cell 1” and “Re-select higher priority Cell 2” is evaluated independently for the statistic, resulting in an event verdict: pass or fail. Each event is evaluated only until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved. Different events may require different times for a verdict.
    If both events pass, the test passes. If one event fails, the test fails.

1. The general test parameter settings are set up according to Table 17.1.1.3.4.1-3.
2. Message contents are defined in clause 17.1.1.3.4.3.
3. The test scenario comprises of 1 NR carrier and 2 cells. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. During T1 and T2, only criteria *stationaryMobilityEvaluation* is configured and fulfilled. UE has not registered with network for the tracking area containing Cell 2.

17.1.1.3.4.2 Test procedure

Two cells are deployed in the test, which are one FR2 NR PCell (Cell 1) and an NR neighbour cell (Cell 2) on the same frequency. The test consists of 2 successive time periods, with time duration of T1 and T2 respectively. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas.

The UE is configured only low mobility criterion defined in clause 5.2.4.9.1 in TS 38.304 [30]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation-r17* defined in TS 38.331 [13] is configured according to the parameters listed in Table 17.1.1.3.5-1;
- cellEdgeEvaluationWhileStationary-r17 defined in TS 38.331 [13] is not configured;
- combineRelaxedMeasCondition2-r17 defined in TS 38.331 [13] is not configured.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a Registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to T1 in Table 17.1.1.3.5-1. T1 starts.
3. The SS waits for random access requests information from the UE to perform cell re-selection to Cell 2.
4. If the UE responds on Cell 2 during time duration T1 within 155 seconds from the beginning of time period T1, then count a success for cell reselection. Otherwise, count a fail for cell reselection.
5. If the UE has re-selected Cell 2 within T1, after the re-selection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and skip to step 11.

6 The SS shall send an *RRCRelease* to ensure that the UE is in state RRC_IDLE.

6. The SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.3.5-1. T2 starts.

8. The SS waits for random access requests information from the UE to perform cell re-selection to an already detected cell, Cell 1.
9. If the UE responds to Cell 1 during time duration T2 within 155 seconds from the beginning of time period T2, then count a success for cell reselection. Otherwise, count a fail for cell reselection.
10. If T2 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and continue with step 11.
11. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
12. Repeat steps 2-11 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 3: SSB_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.						
Note 4: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.						
Note 5: Calculation of Es/IotBB includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor ΔMBP from TS 38.101-2 [3] Table 6.2.1.3-4.						
Note 6: Including the test tolerance given in Annex F.						

The cell re-selection delay to an already detected cell for UE fulfilling stationary relaxed criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 2.

The cell re-selection delay to an already detected cell shall be less than 155 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to an already detectable cell can be expressed as: $T_{evaluate,NR_Intra_RedCap_Relax}$ + T_{SI-NR},

Where:

$T_{evaluate,NR_Intra_RedCap_Relax}$ See Table 4.2B.2.9.2-2 in clause 4.2B.2.9.2,

T_{SI-NR} Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 154.88 s, allow 155 s for the cell reselection delay to an already detected cell for UE fulfilling stationary criterion in the test case.

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

17.1.1.4 NR SA FR2-FR2 Cell reselection for UE fulfilling stationary mobility relaxed measurement criterion for 2 Rx UE

Editor's note: This test case is complete for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- This test case is incomplete for Test frequency f > 40.8 GHz.
- This test case is incomplete for UE power class other than PC3.

17.1.1.4.1 Test purpose

The purpose of this test is to verify the requirement for the NR SA inter-frequency cell reselection in FR2 for 2 Rx RedCap UEs. The requirements are specified in TS 38.133 [6] in clause 4.2B.2.10.2.

17.1.1.4.2 Test applicability

This test applies to all types of NR RedCap UE release 17 and forward supporting Rel-17 relaxed RRM measurements of neighbour cells in RRC_IDLE/RRC_INACTIVE.

17.1.1.4.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 17.1.1.0.4.

The normative reference for this requirement is TS 38.133 [6] clause A.17.1.1.4.

17.1.1.4.4.2 Test procedure

The test consists of one active cell and one neighbour cell on two different NR RF channels. The UE is requested to monitor the neighbouring cell on one of the NR carriers. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas and Cell 2 is of higher priority than Cell 1.

The UE is configured only low mobility criterion defined in clause 5.2.4.9.1 in TS 38.304 [30]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation-r17* defined in TS 38.331 [13] is configured according to the parameters listed in Table 17.1.1.4.5-1;
- *cellEdgeEvaluationWhileStationary-r17* defined in TS 38.331 [13] is not configured;
- *combineRelaxedMeasCondition2-r17* defined in TS 38.331 [13] is not configured.

In the following test procedure “UE responds” means “UE starts transmitting preamble on PRACH for sending the *RRCSETUPREQUEST* message to perform a Registration procedure for mobility.

1. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to T1 in Table 17.1.1.4.5-1. T1 starts.
3. The SS waits for random access requests information from the UE to perform cell reselection to Cell 1.
4. If the UE responds on lower priority Cell 1 during time duration T1 within 155 seconds from the beginning of time period T1, then count a success for the event “Re-select lower priority Cell 1”. Otherwise, count a fail for the event “Re-select lower priority Cell 1”.
5. If the UE has re-selected Cell 1 within T1, after the reselection or when T1 expires, continue with step 6. Otherwise, if T1 expires and the UE has not yet re-selected Cell 1, the TE shall switch off and on the UE and skip to step 11.
6. The SS shall send an *RRCRelease* to ensure that the UE is in state RRC_IDLE.
7. The SS shall switch the power setting from T1 to T2 as specified in Table 17.1.1.4.5-1. T2 starts.
8. The SS waits for random access requests information from the UE to perform cell reselection to an already detected cell, Cell 2.
9. If the UE responds to higher priority Cell 2 during time duration T2 within 155 seconds from the beginning of time period T2, then count a success for the event “Re-select higher priority Cell 2”. Otherwise, count a fail for the event “Re-select higher priority Cell 2”.

10. If T2 expires and the UE has not yet re-selected Cell 2, the TE shall switch off and on the UE and continue with step 11.

11. Ensure the UE is in state RRC_IDLE with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

12. Repeat steps 2-11 until a test verdict has been achieved.
    Each of the events “Re-select lower priority Cell 1” and “Re-select higher priority Cell 2” is evaluated independently for the statistic, resulting in an event verdict: pass or fail. Each event is evaluated only until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved. Different events may require different times for a verdict.
    If both events pass, the test passes. If one event fails, the test fails.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SSB_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

Note 5: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [3] Table 6.2.1.3-4.

Note 6: Including the test tolerance given in Annex F.

The cell re-selection delay to an already detected low priority cell (Cell 1) for UE fulfilling stationary criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 1.

The cell re-selection delay to an already detected low priority cell, Cell 1, shall be less than 155 s.

The cell re-selection delay to an already detected high priority cell (Cell 2) for UE fulfilling stationary criterion is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility on Cell 2.

The cell re-selection delay to an already detected high priority cell, Cell 2, shall be less than 155 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90%.

NOTE 1: The cell re-selection delay to an already detected low priority cell can be expressed as:
$T_{evaluate,NR_Inter_RedCap_Relax} + T_{SI-NR}$

NOTE 2: The cell re-selection delay to an already detected higher priority cell can be expressed as:
$T_{evaluate,NR_Inter_RedCap_Relax} + T_{SI-NR}$

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

17.2 RRC_INACTIVE state mobility for RedCap

17.2.1 Configured Grant based Small Data Transmissions for RedCap

17.2.1.0 Minimum conformance requirements

17.2.1.0.1 Minimum conformance requirements for TA validation using CG-SDT

The requirements in this clause are applicable when the UE is configured with timing alignment (TA) validation using *cg-SDT-RSRP-ChangeThreshold* for transmitting in uplink using CG-SDT as specified in TS 38.331 [13].

The requirements in this clause are applicable for the UE performing small data tranmissions using configured resources as TS 38.331 [13].

The UE is allowed to transmit using the configured uplink resources provided that the UE is synchronized towards (i.e. using the timing derived using the latest available N_{TA} value as specified in sub clause 7.1.2) the serving cell prior to transmission. If the UE is not able to obtain the synchronization towards the serving cell then the UE shall drop the small data transmission. The UE determines the small data transmission occasion according to the received CG-SDT configuration as specified in TS 38.331 [13].

When *cg-SDT-RSRP-ChangeThreshold* as specified in TS 38.331 [13] is configured for TA validation based on the RSRP change criterion according to clause 5.8.2 in TS 38.321 [12], the UE is allowed to transmit using CG-SDT using the timing derived using the latest available N_{TA} value as specified in TS 38.133 [6] sub clause 7.1 provided that

- the first RSRP ($RSRP_1$) measurement and the second RSRP ($RSRP_2$) measurements used in the TA validation are valid measurements and,
- timing alignment validation for transmission using CG-SDT is valid according to the validation criteria in clause 5.8.2 in TS 38.321 [12].

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in Table 17.2.1.0.1-1 are met for FR2-1 regardless of whether the UE is configured with eDRX cycle by serving gNB or core network (AMF).

Table 17.2.1.0.1-1: Valid measurement for FR2-1

Measurement	FR2-1
$RSRP_1$	(T1 – max{480 ms, 8*SMTC periodicity}) ≤ T1' ≤ (T1 + max{480 ms, 8*SMTC periodicity})
$RSRP_2$	(T2 – max{480 ms, 8*SMTC periodicity}) ≤ T2' ≤ T2

If at least one of $RSRP_1$ and $RSRP_2$ is considered to be invalid based on the above conditions, then the UE shall not validate the CG-SDT using $RSRP_1$ and $RSRP_2$ and shall not transmit using CG-SDT. Additionally, for the initial CG-SDT transmission, the UE shall not transmit in an CG-SDT occasion that occurs more than 640 ms after T2.

Where:

- T1 is the time when
  - *RRCRelease* with CG-SDT configuration (TS 38.331 [13]) is received, or
  - the latest TA is received if TA is received while in RRC_INACITVE state.
- T1' is the time when the UE has completed $RSRP_1$.
- T2 is the time when the UE performs TA validation as defined in TS 38.321 [12] clause 5.27.2 for transmission using CG-SDT.
- T2' is the time when the UE has completed $RSRP_2$.
- T_{DRX} is the DRX cycle length in ms.
- M1 the scaling factor as defined in TS 38.133 [6] clause 4.2.2.2.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* as specified in TS 38.331 [13] the following restrictions apply due to SS-RSRP/RSRQ measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on all symbols within SMTC window duration.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* as specified in TS 38.331 [13] the following restrictions apply due to measurement of serving cell.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols of the serving cell.

The UE is not required to meet the following measurement requirements during subsequent SDT transmissions:

- Measurements of inter-frequency NR cells in TS 38.133 [6] clause 5.1.2.4

- Measurements of inter-RAT E-UTRAN cells in TS 38.133 [6] clause 5.1.2.5

- Idle Mode CA/DC Measurements in TS 38.133 [6] clause 5.4

The UE is allowed to delay the reception of PRS resources on the positioning frequency layer until the SDT session is completed if the measurement using PRS resource overlaps with the SDT resources.

The normative reference for this requirement is TS 38.133 [6] clauses 5.2B.

17.2.1.1 NR SA FR2 TA validation for CG-SDT for 2 Rx UE

Editor's note: This test case is incomplete in following aspects:

- Test procedure needs further updates.

- TT analysis is still missing.

17.2.1.1.1 Test purpose

To verify that the UE properly perform TA validation for CG-SDT transmission as specified in TS 38.133 [6] clause 5.2B.2.1.

17.2.1.1.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards and supporting CG-SDT.

17.2.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.2.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.2.1.1.

17.3 RRC_CONNECTED state mobility for RedCap

17.3.1 Handover for RedCap

17.3.1.0 Minimum conformance requirements

17.3.1.0.1 Minimum conformance requirements for NR FR2 – NR FR2 handover

The purpose of NR handover is to change the NR PCell to another NR cell for RedCap UE. The requirements in this clause are applicable to SA NR.

Handover for a RedCap UE is defined as intra-frequency handover if the center frequency and subcarrier spacing (SCS) of the reference SSB of the serving cell is same as the center frequency and SCS of the reference SSB of the target cell, where:

The reference SSB of the serving cell is the SSB in the active DL BWP of serving cell,

The reference SSB of the target cell is the SSB in the first active DL BWP of the target cell upon reconfiguration.

The requirements in this clause apply for the following handover scenarios:

Handover to a target cell's initial DL BWP associated with CD-SSB;

Handover to a target cell's Redcap specific DL BWP associated with NCD-SSB.

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR2 cell to NR FR2 cell.

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [13] plus the interruption time.

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell which depends on whether the target cell is already known when the handover command is received by the UE.

- If the target cell is a known intra-frequency cell, T_{search} = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot $\geq$ -2 dB, then $T_{search} = 8*T_{rs}$ ms.

- If the target cell is a known inter-frequency cell, then

  if the measured SSB is the target SSB for HO of the target cell, T_{search} = 0 ms;

  if the measured SSB and the target SSB for HO belong to the same NR target cell and fulfil the following conditions, $T_{search} = T_{rs}$ ms:

  - CD-SSB in initial DL BWP is the measured SSB and NCD-SSB in RedCap specific DL BWP is the target SSB for HO
  - NCD-SSB in RedCap specific DL BWP is the measured SSB and CD-SSB in initial DL BWP is the target SSB for HO
  - Both measured SSB and the target SSB for HO are NCD-SSBs within different RedCap specific DL BWPs

  Otherwise, the target cell is an unknown inter-frequency cell. In this case, if the target cell Es/Iot $\geq$ -2 dB, then $T_{search} = 24 * T_{rs}$ ms.

Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$ for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the Table 8.1-1 of TS 38.213 [8].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise,

- T_{rs} is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing as NCD-SSB indicated by *nonCellDefiningSSB-r17* if the first active DL BWP included in handover command is configured with *nonCellDefiningSSB-r17*, otherwise, as CD-SSB indicated by *absoluteFrequencySSB* in *frequencyInfoDL* in handover command.
- If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs} = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [13] signaling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In FR2, the target cell is known if it has been meeting the following conditions:

- At least one of the SSBs measured belongs to the same NR target cell,
- During the last 5 seconds before the reception of the handover command:
  - the UE has sent a valid measurement report for the target cell and
  - at least one of the SSBs measured which belongs to the same NR target cell remains detectable according to the cell identification requirements as described in TS 38.133 [6] clause 9.2B for intra-frequency measurements and TS 38.133 [6] clause 9.3B for inter-frequency measurements,
- The reference SSB of the NR target cell also remains detectable during the handover delay according to the cell identification requirements are described in TS 38.133 [6] clause 9.2B for intra-frequency handover and TS 38.133 [6] clause 9.3B for inter-frequency handover.

Otherwise, it is unknown.

The normative reference for this requirement is TS 38.133 [6] clauses 6.1D.1.1 and 6.1D.1.3.

17.3.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.3.1.2.

17.3.1.2.4 Test description

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively.

- At the start of time duration T1, the UE does not have any timing information of Cell 2.
- Starting T2, Cell 2 becomes detectable and the UE receives an RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP, where Cell 2's DL BWP is the Redcap specific BWP associated with NCD-SSB, then UE handover from Cell 1's NCD-SSB to Cell 2's specific Redcap BWP associated with NCD-SSB. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

17.3.1.2.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 17.3.1.2.4.1-1.

Table 17.3.1.2.4.1-1: Supported test configurations

Configuration	Description
17.3.1.2-1	Source cell: NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode Target cell: NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Configure the test equipment and the DUT according to the parameters in Table 17.3.1.2.4.1-2.

17.3.1.2.4.2 Test procedure

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell and its RedCap-specific dedicated BWP is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency (in ARFCN value) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[\left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where:

- f_{CDSSB} is the absolute frequency of Cell 1 CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- f_{pointA} is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- $\Delta\mathrm{F}_{\mathrm{Global}}$ is the granularity of the global frequency raster (in kHz) specified in TS 38.101-2 [3] clause 5.4.2.1;
- $\mathrm{SCS}_{\mathrm{SSB}}$ is the subcarrier spacing of SSB (in kHz);
- $N_{\mathrm{SC}}^{\mathrm{RB}} = 12$, is the number of subcarriers in an RB;
- $N_{\mathrm{SC}}^{\mathrm{SSB}} = 240$, is the number of subcarriers in an SSB.

2. Set the parameters according to T1 in Table 17.3.1.2.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 1) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message implying handover to the RedCap-specific dedicated BWP of Cell 2.

5. At the instant when the last TTI containing the *RRCReconfiguration* message in step 4) is sent to the UE, the SS shall switch the power settings from T1 to T2 as specified in Table 17.3.1.2.5-1. T2 starts. The SS transmits NCD-SSB on Cell 2 with an absolute frequency (in ARFCN value) of

$$f_{\mathrm{NCDSSB}} = f_{\mathrm{pointA}} + \frac{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}} \cdot \left[\left(f_{\mathrm{CDSSB}} - f_{\mathrm{pointA}}\right) \cdot \frac{\Delta\mathrm{F}_{\mathrm{Global}}}{N_{\mathrm{SC}}^{\mathrm{RB}}\mathrm{SCS}_{\mathrm{SSB}}} \right] + \frac{N_{\mathrm{SC}}^{\mathrm{SSB}}\mathrm{SCS}_{\mathrm{SSB}}}{\Delta\mathrm{F}_{\mathrm{Global}}}$$

where:

- f_{CDSSB} is the absolute frequency of Cell 2 CD-SSB (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;
- f_{pointA} is the absolute frequency of Point A (in ARFCN value) specified in TS 38.508-1 [14] clause 7.2.3.1;

- ΔF_{Global} is the granularity of the global frequency raster (in kHz) specified in TS 38.101-2 [3] clause 5.4.2.1;
- SCS_{SSB} is the subcarrier spacing of SSB (in kHz);
- $N_{SC}^{RB} = 12$, is the number of subcarriers in an RB;
- $N_{SC}^{SSB} = 240$, is the number of subcarriers in an SSB.

6. If the UE transmits a PRACH preamble to Cell 2 satisfying the delay requirement specified in clause 17.3.1.2.5 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
7. After T2 expires, the SS shall
   - transmit an *RRCReconfiguration* message to cause the UE handover back to Cell 1. if the handover fails, switch off and on the UE; or
   - switch off and on the UE.
8. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell and its RedCap-specific dedicated BWP is the activated BWP. The SS transmits NCD-SSB on Cell 1 with an absolute frequency given in step 1.
9. Repeat steps 2-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 8: The starting PRB index for dedicated DL BWP corresponding to NCD-SSB PRB index.

Note 9: The starting PRB index for dedicated UL BWP is the same as the dedicated DL BWP corresponding to NCD-SSB PRB index.

The handover delay is measured from the beginning of time period T2 to the time that the UE transmit the first PRACH to Cell 2, which is calculated as follows:

Handover delay = RRC procedure delay + $T_{interrupt}$

- RRC procedure delay = 10 ms, is the RRC processing delay specified in TS 38.331 [13] clause 12,
- $T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin}$, is the interruption time specified in TS 38.133 [6] clause 6.1D.1.2.
  - T_{search} = 1920 ms, is the time required to search the unknown target cell;
  - T_{IU} = 20 ms, is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.
  - $T_{processing}$ = 20 ms, is time for UE processing;
  - T_{Δ} = 80 ms, is time for fine time tracking and acquiring full timing information of the target cell;
  - T_{margin} = 2 ms, is time for SSB post-processing.

This gives a total of 2052 ms.

Note 1: OCNG shall be used such that a constant total transmitted power is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: Es/Iot, SSB_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.
Note 5: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor ΔMB_S from TS 38.101-2 [3] Table 6.2.1.3-4.
Note 6: Including the test tolerance given in Annex F.

17.3.2.1.3 NR SA FR2 RRC re-establishment without serving cell timing

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.

17.3.2.1.3.1 Test purpose

To verify that the NR intra-frequency RRC re-establishment delay in FR2 without serving cell timing is within the specified limits. These tests will verify the requirements in TS 38.133 [6] clause 6.2.1B.

17.3.2.1.3.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards.

17.3.2.1.3.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 17.3.2.1.0.

The normative reference for this requirement is TS 38.133 [6] clause A.17.3.2.1.3.

Note 1: OCNG shall be used such that a constant total transmitted power spectral density is achieved for all OFDM symbols. The OCNG pattern is chosen during the test according to the presence of a DL reference measurement channel.

Note 2: The DL PDSCH reference measurement channel is used in the test only when a downlink transmission dedicated to the UE under test is required.

Note 3: The Δ_{UL} value is calculated as -ROUND(P_{PRACH0} -1), where P_{PRACH0} is the measured first PRACH power with -80.6 dBm/SCS applied, *preambleReceivedTargetPower* = -100 dBm and *ss-PBCH-BlockPower* = 20 dBm. These values are used during the uplink calibration process carried out before the test case is run, with the UE configured to send PRACH.

Note 4: The Δ_{DL} value is calculated as ($RSRP_{REP}$ – RSRP_76), where $RSRP_{REP}$ is the SS-RSRP Reported value in Table 10.1.6.1-1 with -80.6 dBm/SCS applied. These values are used during the downlink calibration process carried out before the test case is run, with the UE configured to report SS-RSRP. For a Reported value RSRP_x, x is treated as a positive integer value.

Note 1: OCNG shall be used such that a constant total transmitted power spectral density is achieved for all OFDM symbols. The OCNG pattern is chosen during the test according to the presence of a DL reference measurement channel.

Note 2: The DL PDSCH reference measurement channel is used in the test only when a downlink transmission dedicated to the UE under test is required.

Note 3: The Δ_{UL} value is calculated as -ROUND(PMsgA0 -1), where PMsgA0 is the measured first MsgA PRACH power with -80.6 dBm/SCS applied, *msgA-PreambleReceivedTargetPower* = -100 dBm and *ss-PBCH-BlockPower* = 20 dBm. These values are used during the uplink calibration process carried out before the test case is run, with the UE configured to send MsgA.

Note 4: The Δ_{DL} value is calculated as ($RSRP_{REP}$ – RSRP_76), where $RSRP_{REP}$ is the SS-RSRP Reported value in Table 10.1.6.1-1 with -80.6 dBm/SCS applied. These values are used during the downlink calibration process carried out before the test case is run, with the UE configured to report SS-RSRP. For a Reported value RSRP_x, x is treated as a positive integer value.

17.3.2.2.4 NR SA FR2 2-step RA type non-contention based random access for 2 Rx UE

Editor's note: This test case is incomplete. The following aspects are either missing or not yet determined:

- The settable window for first preamble uplink power and the uplink calibration process are FFS.
- The test requirement for absolute uplink power is FFS.
- The test requirement for relative uplink power is FFS.
- The uncertainty value and test requirement for PRACH timing are in [ ].
- TT analysis is missing.
- Antenna diagram and any exceptions are FFS.
- Connection setup in Annex C is FFS.

17.3.2.2.4.1 Test purpose

To verify that the behaviour of the 2-step RA type random access procedure is according to the requirements and that the MsgA PRACH, MsgA PUSCH power settings and timing are within specified limits. This test will verify the requirements in TS 38.133 [6] clause 6.2.2B.2 and clause 7.1A.2 in an AWGN model.

17.3.2.2.4.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards and supporting 2-step RACH.

17.4 Timing for RedCap

17.4.1 UE transmit timing for RedCap

17.4.1.0 Minimum Conformance Requirements

17.4.1.0.1 Minimum conformance requirements for UE transmit timing accuracy

The UE shall have capability to follow the frame timing change of the reference cell in connected state or when transmiting PUSCH on CG resources for SDT in RRC_Inactive. The uplink frame transmission takes place $(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_{\mathrm{c}}$ before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. UE initial transmit timing accuracy and gradual timing adjustment requirements are defined in the following requirements.

The UE initial transmission timing error shall be less than or equal to $\pm T_e$ where the timing error limit value T_e is specified in Table 17.4.1.0.1-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission.
- when it is the transmission for PUSCH on CG resources for SDT in RRC_Inactive.

The UE shall meet the T_e requirement for an initial transmission provided that at least one SSB (CD-SSB or NCD-SSB) is available at the UE for acquiring the frame timing of the reference cell during the last 160 ms on the condition that:

- the SSB is within the UE's active BWP, or
- the SSB is not within the UE's active BWP, and the measurement gap is configured.

The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_{\mathrm{c}}$. The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the UE to determine downlink timing is received from the reference cell at UE antenna. N_{TA} for PRACH is defined as 0.

$(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_{\mathrm{c}}$ (in T_c units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in TS 38.133 [6] clause 7.3A was applied. N_{TA} for other channels is not changed until next timing advance is received. The value of $N_{\mathrm{TA\ offset}}$ depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR). $N_{\mathrm{TA\ offset}}$ is defined in Table Table 17.4.1.0.1-2.

Table 17.4.1.0.1-1: T_e Timing Error Limit

Frequency Range	SCS of SSB signals (kHz)	SCS of uplink signals (kHz)	T_e
2	240	120	$3*64*T_c$
Note 1: T_c is the basic timing unit defined in TS 38.211 [7].			

Table 17.4.1.0.1-2: The Value of $N_{\mathrm{TA\ offset}}$

Frequency range and band of cell used for uplink transmission	$N_{\mathrm{TA\ offset}}$ (Unit: T_C)
FR2	13792

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH and SRS transmission, the UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell except when the timing advance in TS 38.133 [6] clause 7.3A is applied.

When the transmission timing error between the UE and the reference timing exceeds $\pm T_e$ then the UE is required to adjust its timing to within $\pm T_e$. The reference timing shall be $(N_{TA} + N_{TA\ offset}) \times T_c$ before the downlink timing of the reference cell. All adjustments made to the UE uplink timing shall follow these rules:

1) The maximum amount of the magnitude of the timing change in one adjustment shall be T_q.

2) The minimum aggregate adjustment rate shall be T_p per second.

3) The maximum aggregate adjustment rate shall be T_q per 200 ms.

   where the maximum autonomous time adjustment step T_q and the aggregate adjustment rate T_p are specified in Table 17.4.1.0.1-3.

Table 17.4.1.0.1-3: T_q Maximum Autonomous Time Adjustment Step and T_p Minimum Aggregate Adjustment rate

Frequency Range	SCS of uplink signals (kHz)	T_q	T_p
2	120	2.5*64*T_c	2.5*64*T_c
NOTE: T_c is the basic timing unit defined in TS 38.211 [7].			

The normative reference for this requirement is TS 38.133 [6] clauses 7.1A.1 and 7.1A.2.

17.4.1.1 NR SA FR2 NR UE Transmit Timing accuracy for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.

17.4.1.1.1 Test purpose

To verify that the UE can follow frame timing change of the connected gNB and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in TS 38.133 [6] clause 7.1A.2.

17.4.1.1.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onward and supporting FR2.

17.5 Signalling characteristics for RedCap

17.5.1 Radio link monitoring for RedCap

17.5.1.0 Minimum requirements

17.5.1.0.1 General

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [8]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP. The SSB and SMTC in this section applies for both CD-SSB and NCD-SSB if it is not additional specified.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds Q_{out} and Q_{in} for the purpose of monitoring downlink radio link quality of the cell.

The threshold Q_{out} is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in Table 17.5.1.0.1-1. For SSB based radio link monitoring, $Q_{out_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-2. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-4.

The threshold Q_{in} is defined as the level at which the downlink radio link quality can be significantly more reliably received than at Q_{out} and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in Table 17.5.1.0.1-1. For SSB based radio link monitoring, $Q_{in_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-3. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in Table 17.5.1.0.1-5.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *RLM-IS-OOS-thresholdConfig* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in Table 17.5.1.0.1-1 as default. All requirements here are applicable for BLER Configuration #0 in Table 17.5.1.0.1-1.

Table 17.5.1.0.1-1: Out-of-sync and in-sync block error rates

Configuration	$BLER_{out}$	$BLER_{in}$
0	10%	2%

UE shall be able to monitor up to N_{RLM} RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number L_{max} of SSBs per half frame according to TS 38.213 [8], where N_{RLM} is specified in Table 17.5.1.0.1-6 according TS 38.213 [8], and meet the requirements as specified in TS 38.133 [6] clause 8.1B. UE is not required to meet the requirements in TS 38.133 [6] clause 8.1B if RLM-RS is not configured and no TCI state for PDCCH is activated.

NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [8].		

When the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource during one evaluation period, the UE is allowed to restart the ongoing evaluation using the second SSB type after BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

The requirements in TS 38.133 [6] clause 8.1.4 shall also apply except the scenarios described above.

The requirements in TS 38.133 [6] clause 8.1.5 shall apply.

When the downlink radio link quality on all the configured RLM-RS resources is worse than Q_{out}, Layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A Layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [13].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,RedCap}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [13].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [8]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,RedCap}$.

When DRX is not used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to T_{SSB} specified in TS 38.133 [6] clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in TS 38.133 [6] clause 8.1B.3 if the RLM-RS resource is CSI-RS.

In case DRX is used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX cycle_length is less than or equal to 320 ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX cycle_length is greater than 320 ms. Upon start of T310 timer as specified in TS 38.331 [13], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE is expected to receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE is expected to receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

The normative reference for this requirement is TS 38.133 [6] clauses 8.1B.1, 8.1B.2, 8.1B.3, 8.1B.4, 8.1B.5, 8.1B.6 and 8.1B.7.

17.5.1.0.2 Minimum conformance requirements for SSB-based RLM

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in this clause.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,RedCap}$ ms period becomes worse than the threshold $Q_{out_SSB,RedCap}$ within $T_{Evaluate_out_SSB,RedCap}$ ms evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,RedCap}$ ms period becomes better than the threshold $Q_{in_SSB,RedCap}$ within $T_{Evaluate_in_SSB,RedCap}$ ms evaluation period.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in Table 17.5.1.0.2-1 and for FR2 with scaling factor N = 8 for 2 Rx RedCap.

DRX cycle > 320 ms	Ceil(10 × P × N) × T_{DRX}	Ceil(5 × P × N) × T_{DRX}
NOTE: T_{SSB} is the periodicity of the SSB configured for RLM. T_{DRX} is the DRX cycle length.		

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

Longer evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

For FR2, when the SSB for RLM measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

The normative reference for this requirement is TS 38.133 [6] clause 8.1B.2.

17.5.1.0.3 Minimum conformance requirements for CSI-RS based RLM

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in this clause. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS,RedCap}$ ms period becomes worse than the threshold $Q_{out_CSI-RS,RedCap}$ within $T_{Evaluate_out_CSI-RS,RedCap}$ ms evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS,RedCap}$ ms period becomes better than the threshold $Q_{in_CSI-RS,RedCap}$ within $T_{Evaluate_in_CSI-RS,RedCap}$ ms evaluation period.

$T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ are defined in Table 17.5.1.0.3-1 for FR2 with scaling factor N = 1 for 2 Rx RedCap.

Table 17.5.1.0.3-1: Evaluation period $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ for FR2 for 2 Rx RedCap UE

Configuration	$T_{Evaluate_out_CSI-RS,RedCap}$ (ms)	$T_{Evaluate_in_CSI-RS,RedCap}$ (ms)
no DRX	Max(200, Ceil($M_{out,RedCap}$×P×N)×T_{CSI-RS})	Max(100, Ceil($M_{in,RedCap}$×P×N) × T_{CSI-RS})
DRX ≤ 320 ms	Max(200, Ceil(1.5×$M_{out,RedCap}$×P×N)× Max(T_{DRX}, T_{CSI-RS}))	Max(100, Ceil(1.5×$M_{in,RedCap}$×P×N)× Max(T_{DRX}, T_{CSI-RS}))
DRX > 320 ms	Ceil($M_{out,RedCap}$×P×N) × T_{DRX}	Ceil($M_{in,RedCap}$×P×N) × T_{DRX}
NOTE: T_{CSI-RS} is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for T_{CSI-RS} equal to 5 ms, 10 ms, 20 ms or 40 ms. T_{DRX} is the DRX cycle length.		

For FR2,

- P = 1, when the RLM-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is not overlapped with SMTC occasion (T_{CSI-RS} < MGRP)

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P = P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)

- $P_{sharing\ factor} = 1$, if the RLM-RS resource outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor} = 3$, otherwise.

where,

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; otherwise $T_{SMTCperiod}$ follows *smtc1*.

If the high layer in TS 38.331 [13] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; 0therwise $T_{SMTCperiod}$ follows *smtc1*.

Note: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

The values of $M_{out,RedCap}$ and $M_{in,RedCap}$ used in Table 17.5.1.0.3-1 for UE with 2 Rx are defined as:

- $M_{out,RedCap} = 20$ and $M_{in,RedCap} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

Longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement, or in the same symbol as SSB for CBD when beam failure is detected, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.
  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

The normative reference for this requirement is TS 38.133 [6] clause 8.1B.3.

17.5.1.1 NR SA FR2 Radio Link Monitoring Out-of-sync Test for FR2 PCell configured with SSB-based RLM RS in non-DRX mode for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- Normal conditions.
- The test is incomplete for UE power classes other than PC3 (e.g. PC7).
- The test is incomplete for test frequencies > 40.8 GHz.
- The test is incomplete for extreme conditions.

17.5.1.1.1 Test purpose

To verify that the UE properly detects the out-of-sync and in-sync for the purpose of monitoring downlink radio link quality of the PCell. This test will partly verify the FR2 radio link monitoring requirements in TS 38.133 [6] clause 8.1B.

17.5.1.1.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards.

17.5.1.5 NR SA FR2 Radio Link Monitoring Out-of-sync Test for FR2 PCell configured with CSI-RS-based RLM in non-DRX mode for 2 Rx UE

Editor's note: This test case is incomplete due to the following:

- Usage of 2 antenna ports in CSI-RS 3.1 TDD implies SS transmitting signal on both polarizations. Potential signal imbalance impact to the test verdict is under investigation.
- Test Tolerances are available for the following configurations:
  - Test frequency f ≤ 40.8 GHz.
  - UE PC3.

- The Test Tolerances are incomplete for UE power classes other than PC3.
- The Test Tolerances are incomplete for test frequencies > 40.8 GHz.

17.5.1.6 NR SA FR2 Radio Link Monitoring In-sync Test for FR2 PCell configured with CSI-RS-based RLM in non-DRX mode for 2 Rx UE

Editor's note: This test case is incomplete due to the following:

- Procedure to ensure signal balancing in 2AoA setups is still FFS.
- Signal levels and propagation conditions need further evaluation.
- Usage of 2 antenna ports in CSI-RS 3.1 TDD implies SS transmitting signal on both polarizations. Potential signal imbalance impact to the test verdict is under investigation.
- Test Tolerances are available for the following configurations:
  - Test frequency f ≤ 40.8 GHz.

- UE PC3.

- The Test Tolerances are incomplete for UE power classes other than PC3.

- The Test Tolerances are incomplete for test frequencies > 40.8 GHz.

17.5.1.6.1 Test purpose

To verify that the UE properly detects the in-sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when no DRX is used. This test will partly verify the FR2 PCell CSI-RS In-sync radio link monitoring requirements in TS 38.133 [6] clause 8.1B.3.

Note 11: This value allows up to 1 dB degradation from applied SNR to UE baseband.

17.5.1.7 NR SA FR2 Radio Link Monitoring Out-of-sync Test for FR2 PCell configured with CSI-RS-based RLM in DRX mode for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.

17.5.1.7.1 Test purpose

To verify that the UE properly detects the out-of-sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when DRX is used. This test will partly verify the FR2 PCell CSI-RS Out-of-sync radio link monitoring requirements in TS 38.133 [6] clause 8.1B.3.

17.5.1.7.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards supporting FR2, CSI-RS based RLM and long DRX cycle.

- Test frequency f ≤ 40.8 GHz
- UE PC3
- Normal conditions

The test is incomplete for UE power classes other than PC3

The test is incomplete for test frequencies > 40.8 GHz

17.5.1.9.1 Test purpose

To verify that the NR UE correctly follows the RLM scheduling restrictions requirements defined in TS 38.133 [6] clause 8.1B.7. This test verifies that the UE correctly receive the PDCCH scheduled on the symbols right before the RLM SSB symbols without overlap so that it sends ACK/NACK correctly.

17.5.1.9.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards supporting *pdcch-MonitoringAnyOccasions* or *pdcch-MonitoringAnyOccasionsWithSpanGap*.

17.5.2.0.3 Scheduling availability of UE during beam failure detection and candidate beam detection

The minimum requirements given in clause 5.5.5.0.3 applies.

The normative reference for this requirement is TS 38.133 [6] clauses 8.5B.1, 8.5B.2, 8.5B.4, 8.5B.5, 8.5B.7, 8.5B.8 and 8.5B.9.

17.5.2.1 NR SA FR2 Beam Failure Detection and Link Recovery Test for FR2 PCell configured with SSB-based BFD and LR in non-DRX mode for 2 Rx UE

Editor's Note:

This test case is complete for the following configurations:

- UE PC3
- Test frequencies f ≤ 40.8 GHz;

This test case is incomplete for UE power classes other than PC3;

17.5.2.1.1 Test purpose

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set q_0 configured for a serving cell and that the UE performs correct SSB-based link recovery based on beam candidate set q_1. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR2 serving cell requirements in TS 38.133 [6] clause 8.5B.

17.5.2.1.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards.

17.5.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.5.2.1.

Note 1: OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T1.
Note 3: NZP CSI-RS resource set configuration for CSI reporting is assigned to the UE prior to the start of time period T1.
Note 4: The timers and layer 3 filtering related parameters are configured prior to the start of time period T1.
Note 5: The signal contains PDCCH for UEs other than the device under test as part of OCNG.
Note 6: SNR levels correspond to the signal to noise ratio over the REs carrying CSI-RS.
Note 7: The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2 and SNR3 respectively in figure 7.5.5.3.4-1.
Note 8: The SNR values are specified for testing a UE which supports 2 Rx on at least one band.
Note 9: Information about types of UE beam is given in TS 38.133 [6] clause B.2.1.3 and does not limit UE implementation or test system implementation.
Note 10: This value allows up to 1 dB degradation from applied SNR to UE baseband.

17.5.2.4 NR SA FR2 Beam Failure Detection and Link Recovery Test for FR2 PCell configured with CSI-RS-based BFD and LR in DRX mode for 2 Rx UE

Editor's Note:

This test case is complete for the following configurations:

- UE PC3
- Test frequencies f ≤ 40.8 GHz;

This test case is incomplete for UE power classes other than PC3;

This test case is incomplete for test frequencies f > 40.8 GHz.

17.5.2.4.1 Test purpose

To verify that the UE properly detects CSI-RS-based beam failure in the set q_0 configured for a serving cell and that the UE performs correct CSI-RS-based link recovery based on beam candidate set q_1. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery for an FR2 serving cell requirements in TS 38.133 [6] clause 8.5B.

17.5.2.4.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards supporting CSI-RS-based RLM, long DRX cycle and link recovery.

17.5.2.4.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.2.0.2.

17.5.3 Active BWP switch delay for RedCap

17.5.3.1 DCI-based and time-based active BWP switch for RedCap

17.5.3.1.0 Minimum conformance requirements for DCI-based and time-based active BWP switch

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y = 0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL half-subframe (FR2) immediately after a BWP-inactivity timer *bwp-InactivityTimer* defined in TS 38.331 [13] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* defined in TS 38.331 [13] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* defined in TS 38.331 [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in Table 17.5.3.1.0-1.

Table 17.5.3.1.0-1: BWP switch delay

μ	NR Slot length (ms)	BWP switch delay $T_{BWPswitchDelay}$ (slots)	
		Type 1[Note 1]	Type 2[Note 1]
3	0.125	6	18
Note 1: Depends on UE capability. Note 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch.			

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in TS 38.133 [6] clause 8.10 in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in TS 38.133 [6] clause 8.10 in the new BWP.

The normative reference for this requirement is TS 38.133 [6] clause 8.6A.2.

17.5.3.1.1 NR SA FR2 DCI-based and Timer-based DL active BWP switch for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.

17.5.3.1.1.1 Test purpose

To verify the DL BWP switch delay requirement defined in in TS 38.133 [6] clause 8.6A.

17.5.3.1.1.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards and supporting BWP adaptation of at least 2 BWPs, DCI and timer-based active BWP switching delay Type1 or Type2.

17.5.3.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.3.1.0.

17.5.3.1.1.4.2 Test procedure

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 1 and the time duration of T2.

The Cell 1 has constant signal levels throughout the test.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to Tables 17.5.3.1.1.4.1-3, 17.5.3.1.1.5-1 and 17.5.3.1.1.5-2.

3. The SS shall transmit an *RRCReconfiguration* message releasing the dedicated configuration of the *initialDownlinkBWP* and the *initialUplinkBWP*. This message also configures 2 different UE-specific bandwidth parts, BWP-1 and BWP-2, which always include the bandwidth of the initial DL BWP and SSB. The SS indicates BWP-1 as the active DL BWP using *firstActiveDownlinkBWP-Id*. UE is configured with a *bwp-InactivityTimer* timer value for Cell 1.

4. The SS sends a DCI format 1_1 to trigger Cell 1 DL BWP switch. T1 starts from the slot (denoted as slot #i) in which the UE receiving the DCI format 1_1.

5. If the UE,

   - starts to report valid ACK/NACK for Cell 1 on BWP-2 from the first UL slot that occurs after the beginning of DL slot ($i+T_{BWPswitchDelay}+k_1$),

   then count a success for the event “DCI-based”, go to step 6. Otherwise, count a fail for the event “DCI-based”, switch off/on the UE and go to step 1.

6. T2 starts. During T2 the SS stops scheduling DL reception on Cell 1 to let timer *bwp-InactivityTimer* expire.

7. T3 starts from the first slot (denoted as slot #j) of the DL half-frame immediately after the timer *bwp-InactivityTimer* expires. During T3 the SS restarts scheduling DL reception on Cell 1.

8. If the UE,

   - starts to report valid ACK/NACK for Cell1 on BWP 1 from the first UL slot that occurs after the beginning of DL slot ($j+T_{BWPswitchDelay}+k_1$). The number of successful subtests is increased by one and go to step 9 after T3 expires. Otherwise, count a fail for the test, switch off/on the UE and go to step 1.

   then count a success for the event “Timer-based”, go to step 9. Otherwise, count a fail for the event “Timer-based”, switch off/on the UE and go to step 1.

9. Repeat steps 4-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

If all events pass, the test passes. If one event fails, the test fails.

Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 2: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 5: As observed with 0 dBi gain antenna at the centre of the quiet zone.
Note 6: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

During T1, the UE shall start to send the ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot ($i + T_{BWPswitchDelay} + k_1$).

During T3, the UE shall start to send the ACK/NACK for PCell from the first UL slot that occurs right after the beginning of DL slot ($j + T_{BWPswitchDelay} + k_1$).

Where, k_1 is the timing between DL data receiving and acknowledgement as specified in TS 38.214 [9].

Depending on UE capability *bwp-SwitchingDelay* defined in TS 38.331 [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in TS 38.133 [6] Table 8.6A.2-1.

All of the above test requirements shall be fulfilled in order for the observed PCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK/NACK in the first UL slot that occurs after beginning of DL slot ($i + T_{BWPswitchDelay}+k_1$), ($j + T_{BWPswitchDelay} + k_1$), then the UE shall use the next available uplink resource for reporting the corresponding ACK/NACK.

17.5.3.2 RRC-based active BWP switch for RedCap

17.5.3.2.0 Minimum conformance requirements for RRC-based active BWP switch

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

Active BWP switch or parameter change of its active BWPs for PCell

Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* and *firstActiveUplinkBWP-Id* for SCell

For RRC-based BWP switch, after the UE receives *RRCreconfiguration* involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessing\,Delay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in ms as defined in clause 11.2 in TS 36.331 [29] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [13], and

$T_{BWPswitchDelayRRC} = 6\ ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP switch occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where T_{HARQ} is the time between DL data transmission and acknowledgement as specified in TS 38.213 [8].

The normative reference for this requirement is TS 38.133 [6] clauses 8.6A.3.

17.5.3.2.1 NR SA FR2 RRC-based DL active BWP switch for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.

17.5.3.2.1.1 Test purpose

To verify the DL BWP switch delay requirement for RRC-based BWP switch defined in in TS 38.133 [6] clause 8.6A.3.

17.5.3.2.1.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards and supporting BWP adaptation of at least 2 BWPs.

17.5.3.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.3.2.0.

The normative reference for this requirement is TS 38.133 [6] clause A.17.5.3.2.1.

17.5.3.2.1.4 Test description

17.5.3.2.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 17.5.3.2.1.4.1-1.

Table 17.5.3.2.1.4.1-1: Supported test configurations

Config	Description
17.5.3.2.1-1	NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode
17.5.3.2.1-2	NR 240 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode
Note 1: The UE is only required to be tested in one of the supported test configurations.	

Configure the test equipment and the DUT according to the parameters in Table 17.5.3.2.1.4.1-2.

1. The general test parameter settings are set up according to Table 17.5.3.2.1.4.1-3.

2. Message contents are defined in clause 17.5.3.2.1.4.3.

3. The test scenario comprises of one NR PCell (Cell 1). Cell 1 is configured according to Annex C.1.2 and C.1.3.

Table 17.5.3.2.1.4.1-3: General test parameters

Parameter	Unit	Value	Comment

T1	s	0.2	

17.5.3.2.1.4.2 Test procedure

The test consists of 1 time period, with duration of T1. Cell 1 has constant signal level throughout the test. PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to Table 17.5.3.2.1.4.1-3, Table 17.5.3.2.1.5-1 and Table 17.5.3.2.1.5-2. Propagation conditions are set according to Annex C clauses C.2.2.

3. The SS shall send an *RRCReconfiguration* message releasing the dedicated configuration of the *initialDownlinkBWP* and the *initialUplinkBWP*. This message also configures another UE-specific bandwidth part, BWP-1 and indicates BWP-1 as the active DL BWP using *firstActiveDownlinkBWP-Id*, according to the initial condition of Active BWP-1 in Table 17.5.3.2.1.5-1.

4. The UE shall transmit an *RRCReconfigurationComplete* message.

5. The SS shall send an *RRCReconfiguration* message with updated bandwidth part configuration for DL BWP switch, change the BWP according to the final condition of Active BWP-1 in Table 17.5.3.2.1.5-1. T1 starts.

6. The UE shall receive the *RRCReconfiguration* in PCell's slot # denoted i and reconfigure its bandwidth part with the updated bandwidth part configuration.

7 If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot $i + X + k_1$ then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one. Where:

   - X = 128 for test configuration 17.5.3.2.1-1;

   - X = 256 for test configuration 17.5.3.2.1-2.

8. After the SS receives the ACK/NACK in step 7) or when T1 expires, the SS shall transmit *RRCRelease* message to release the RRC connection.

9. After the RRC connection release, the SS:

   - transmits in NR Cell 1 a Paging message for the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 (if the paging fails, switches off and on the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5),

   or

   - switches off and on the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

The SS verifies the DL BWP switch time in PCell by counting the slots from the time when the *RRCReconfiguration* message including updated BWP configuration is sent till a valid ACK/NACK is received.

Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.		
Note 2: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.		
Note 3: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.		
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone		
Note 5: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.		

During T1, the UE shall be ready for the reception of uplink grant for PCell from the first DL slot that occurs after the beginning of slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$ and starts to report valid ACK/NACK for the PCell from the first UL slot that occurs after the beginning of DL slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$ + k1.

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in TS 38.214 [9].

All of the above test requirements shall be fulfilled in order for the observed PCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

17.5.5 Uplink spatial relation switch delay for RedCap

17.5.5.1 MAC-CE based Spatial Relation switch for RedCap

17.5.5.1.0 Minimum conformance requirements MAC-CE based uplink spatial relation switch delay

The spatial relation associated to DL RS is known if the following conditions are met:

- During the period from the last transmission of the DL RS resource used for the L1-RSRP measurement reporting for the target spatial relation to the completion of active spatial relation, where the DL RS resource for L1-RSRP measurement is the DL RS in target spatial relation or QCLed to the target spatial relation with QCL type-D.
  - Spatial relation switch command is received within 1280 ms upon the last transmission of the DL RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target spatial relation before the spatial relation switch command
  - The DL RS configured in spatial relation remains detectable during the spatial relation switching period
    - SNR of the DL RS configured in spatial relation ≥ -3 dB
  - The SSB associated with the spatial relation remain detectable during the spatial relation switching period
    - SNR of the SSB associated with the spatial relation ≥ -3 dB

Otherwise, the spatial relation is unknown.

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation no later than slot n+ T_{HARQ} + $3N_{slot}^{subframe,\mu}$+ 1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1 where T_{HARQ} is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [8].

If the target spatial relation associated to DL RS is unknown and UE is configured with uplink resources for transmission on target spatial relation, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation no later than slot n+ T_{HARQ} + $3N_{slot}^{subframe,\mu}$+ $T_{L1\text{-}RSRP}$+1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- T_{HARQ} is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [8],
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
  - $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ for SSB as specified in clause 9.5B,
    - with the assumption of M = 1
    - with T_{Report} = 0
  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ for CSI-RS as specified in clause 9.5.4.2
    - configured with higher layer parameter *repetition* set to ON
    - with the assumption of M = 1 for periodic CSI-RS
    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
    - with $_{T}$Report = 0

The UE shall be able to transmit with the old UL spatial relation until slot n+ T_{HARQ} + $3N_{slot}^{subframe,\mu}$.

When the UL spatial relation info switch for PUCCH changes both the associated DL RS and *pucch-PathlossReferenceRS* with the same MAC-CE activation, and if both the DL RS and *pucch-PathlossReferenceRS* are known as specified in clauses 8.12A.2 and 8.14.2 respectively, the UE shall be able to transmit PUCCH with the target UL spatial relation after the delay specified in clause 8.14.3. If either the associated DL RS or *pucch-PathlossReferenceRS* are unknown, a longer switching delay is allowed. The UE is not required to transmit PUCCH with the target UL spatial relation until the DL RS and pathloss reference RS switch are completed.

The normative reference for this requirement is TS 38.133 [6] clauses 8.12A.2 and 8.12A.3.

17.5.5.1.1 NR SA FR2 MAC-CE based spatial relation switch associated with known DL-RS for 2 Rx UE

Editor's note: This test case is incomplete in following aspects:

- Message contents are still TBD.
- TT analysis is available for the following configurations:
  - Test frequency f ≤ 40.8 GHz.
  - UE PC3.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.

17.5.5.1.1.1 Test purpose

To verify fulfillment of the uplink spatial relation switch delay requirement defined in TS 38.133 [6] clause 8.12A.3 by a UE capable of beam correspondence without the need for UL beam sweeping.

17.5.5.1.1.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards.

17.5.5.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.5.1.0.

Note 2: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 3: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone
Note 5: As observed with 0 dBi gain antenna at the center of the quiet zone.
Note 6: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3 and does not limit UE implementation or test system implementation.

17.5.5.2 RRC based spatial relation switch for RedCap

17.5.5.2.0 Minimum conformance requirements RRC based uplink spatial relation switch delay

The spatial relation associated to DL RS is known if the following conditions are met:

- During the period from the last transmission of the DL RS resource used for the L1-RSRP measurement reporting for the target spatial relation to the completion of active spatial relation, where the DL RS resource for L1-RSRP measurement is the DL RS in target spatial relation or QCLed to the target spatial relation with QCL type-D.
  - Spatial relation switch command is received within 1280 ms upon the last transmission of the DL RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target spatial relation before the spatial relation switch command
  - The DL RS configured in spatial relation remains detectable during the spatial relation switching period
    - SNR of the DL RS configured in spatial relation ≥ -3 dB
  - The SSB associated with the spatial relation remain detectable during the spatial relation switching period
    - SNR of the SSB associated with the spatial relation ≥ -3 dB

Otherwise, the spatial relation is unknown.

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured no later than slot n+ $T_{RRC_processing}$ /*NR slot length* +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,

- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [29] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [13].

If the target spatial relation associated to DL RS is unknown and UE is configured with uplink resources for transmission on target spatial relation, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured no later than slot n+ $T_{RRC_processing}$ /*NR slot length* + $T_{L1\text{-}RSRP}$ +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [29] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [13].
- $T_{L1\text{-}RSRP}$ is defined in clause 8.12A.3

For RedCap UE in HD-FDD mode, if a downlink reception overlaps with target periodic SRS with spatial relation of the serving cell with periodic SRS with spatial relation reconfigured then the UE is allowed to postpone the uplink transmission.

The normative reference for this requirement is TS 38.133 [6] clauses 8.12A.2 and 8.12A.5.

17.5.5.2.1 NR SA FR2 RRC-based spatial relation switch associated with a known DL-RS for 2 Rx UE

Editor's note: This test case is incomplete in following aspects:

- Message contents are still TBD.
- TT analysis is available for the following configurations:
  - Test frequency f ≤ 40.8 GHz.
  - UE PC3.
- The test is incomplete for UE power classes other than PC3.
- -- The test is incomplete for test frequencies > 40.8 GHz.

17.5.5.2.1.1 Test purpose

To verify fulfillment of the uplink spatial relation switch delay requirement defined in TS 38.133 [6] clause 8.12A.5 by a UE capable of beam correspondence without the need for UL beam sweeping.

17.5.5.2.1.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards.

17.5.5.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.5.2.0.

The normative reference for this requirement is TS 38.133 [6] clause A.17.5.5.2.1.

17.5.6 UE specific CBW change for RedCap

17.5.6.0 Minimum conformance requirements

17.5.6.0.1 Minimum conformance requirements for UE specific CBW change

The minimum conformance requirements given in clause 16.5.4.0.1 applies.

17.5.6.1 NR SA FR2 UE specific CBW change on PCell for 2 Rx UE

17.5.6.1.1 Test purpose

To verify the UE specific CBW change delay requirement defined in TS 38.133 [6] clause 8.13A.

17.5.6.1.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards.

17.5.6.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.5.6.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.5.6.1.

17.5.6.1.4 Test description

The test scenario comprises of one Cell, PCell (Cell 1), which has constant signal levels throughout the test. The test consists of 1 time period with duration of T1.

During T1 the TE sends an *RRCReconfiguration* message containing *SCS-SpecificCarrier* to reconfigure UE-specific CBW. The test equipment verifies the UE specific CBW switching delay in PCell by estimating the time from the moment the *RRCReconfiguration* message including updated UE-specific CBW configuration is sent to the moment a valid ACK/NACK is received.

17.5.6.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 17.5.6.1.4.1-1.

17.5.6.1.4.2 Test procedure

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. UE has been configured with UE specific CBW (CBW-1), initial BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.
2. The SS starts sending PDCCHs indicating new transmissions continuously on Cell 1.
3. The SS sends an *RRCReconfiguration* message containing *SCS-SpecificCarrier* with updated UE specific CBW (CBW-2), dedicated BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.
4. T1 starts from the beginning of the last slot (denoted as slot #i) carrying the PDSCH containing the *RRCReconfiguration* message in step 3.

5 If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot i + $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$, then the number of successful tests is increased by one.
Otherwise, the number of failure tests is increased by one.

6. After the SS receives the ACK/NACK in step 5 or when T1 expires, the SS shall

   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.

7. Depending on the choice in step 6, the SS shall,

   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 6. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 6.

8. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. UE has been configured with UE specific CBW (CBW-1), initial BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.

9. Repeat steps 2-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

During T1, the UE shall be ready for the reception of uplink grant for PCell from the first DL slot that occurs after the beginning of slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{CBWchangeDelayRRC}}}{\text{NR Slot length}}$ and starts to report valid ACK/NACK for the PCell from the first UL slot that occurs after the beginning of DL slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{CBWchangeDelayRRC}}}{\text{NR Slot length}}$ + k1.

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in TS 38.213 [8].

All of the above test requirements shall be fulfilled in order for the observed PCell UE specific CBW change delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

17.6 Measurement procedures for RedCap

17.6.1 Intra-frequency measurements for RedCap

17.6.1.0 Minimum conformance requirements

17.6.1.0.1 General

A measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the reference SSB of the serving cell and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same. The reference SSB is the SSB defined in BWP-specific *servingCellMO* under *BWP-DownlinkDedicated* of active DL BWP. If the field is absent, the reference SSB is the SSB defined in *servingCellMO* under *ServingCellConfig*.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP as specified in 3GPP TS 38.213 [8].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in TS 38.133 [6] clause 9.2B.5.3.

SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range 1.

The requirements in this clause apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap:
  - SS-RSRP related side conditions given in TS 38.133 [6] clauses 10.1.2 and 10.1.3 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in TS 38.133 [6] clauses 10.1.7 and 10.1.8 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in TS 38.133 [6] clauses 10.1.12 and 10.1.13 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.

For 2 Rx RedCap: The requirements in TS 38.133 [6] clause 9.2.4.3 shall apply.

The UE shall not send any event triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty

is: 2 x TTI_{DCCH}. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ without\ index_RedCap}$ defined in clause 17.6.1.0.2 or clause 17.6.1.0.3. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index_RedCap}$ as defined in clause 17.6.1.0.2 or clause 17.6.1.0.3. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index_RedCap}$ defined in clause 17.6.1.0.2 or clause 17.6.1.0.3 becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ T_c while the measurement gap has not been available and L3 filtering has not been used, where μ is the SCS configuration as defined in clause 4.2 of TS 38.211 [7]. When L3 filtering is used, an additional delay can be expected.

The normative reference for this requirement is TS 38.133 [6] clauses 9.2B.1 and 9.2B.4.3.

17.6.1.0.2 Minimum conformance requirements for event-triggered measurement without gap

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR2.

$$T_{identify_intra_without_index_RedCap} = (T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in Table 17.6.1.0.2-1.

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in Table 17.6.1.0.2-2.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non-overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

if the high layer in TS 38.331 [13] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

For 2 Rx RedCap:

$M_{pss/sss_sync_w/o_gaps_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_w/o_gaps_RedCap} = 40$. For a UE supporting power class 2, $M_{pss/sss_sync_w/o_gaps_RedCap} = 24$. For a UE supporting FR2 power class 3, $M_{pss/sss_sync_w/o_gaps_RedCap} = 24$. For a UE supporting FR2 power class 4, $M_{pss/sss_sync_w/o_gaps_RedCap} = 24$. For a UE supporting FR2 power class 7, $M_{pss/sss_sync_w/o_gaps_RedCap} = 24$.

$M_{meas_period_w/o_gaps_RedCap}$: For a UE supporting power class 1 or 5, $M_{meas_period_w/o_gaps_RedCap} = 40$. For a UE supporting FR2 power class 2, $M_{meas_period_w/o_gaps_RedCap} = 24$. For a UE supporting power class 3, $M_{meas_period_w/o_gaps_RedCap} = 24$. For a UE supporting power class 4, $M_{meas_period_w/o_gaps_RedCap} = 24$. For a UE supporting power class 7, $M_{meas_period_w/o_gaps_RedCap} = 24$.

When intra-frequency SMTC is fully non-overlapping with measurement gaps or intra-frequency SMTC is fully overlapping with MGs, Kp = 1.

When intra-frequency SMTC is partially overlapping with measurement gaps, Kp = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. For calculation of Kp, if the high layer signalling (TS 38.331 [13]) of *smtc2* is

configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

If the higher layer signalling in TS 38.331 [13] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index_RedCap}$.

For FR2,

$K_{layer1_measurement}$ = 1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or

- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$ = 1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

If the higher layer signalling in TS 38.331 [13] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra_RedCap}$.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 intra-frequency cell

> The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration (The signalling *deriveSSB_IndexFromCell* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [13], the SMTC periodicity follows *smtc2*; otherwise the SMTC periodicity follows *smtc1*.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration (The signalling *deriveSSB_IndexFromCellc* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [13], the SMTC periodicity follows *smtc2*; otherwise the SMTC periodicity follows *smtc1*.

If following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots.

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE is expected to receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE is expected to receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

The normative reference for this requirement is TS 38.133 [6] clauses 9.2B.5.

17.6.1.0.3 Minimum conformance requirements for event-triggered measurement with gap

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). The UE shall be able to identify a new detectable intra-

frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap}$. It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR2.

$$T_{identify_intra_without_index_RedCap} = T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap} \text{ ms}$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in Table 17.6.1.0.3-1.

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in Table 17.6.1.0.3-2.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.2 for measurement conducted within measurement gaps.

17.6.1.1 NR SA FR2 event triggered reporting without gap in non-DRX for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- This test case is incomplete for UE power classes other than PC3 (e.g. PC7).
- This test case is incomplete for test frequencies > 40.8 GHz.

17.6.1.1.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the TDD intra-frequency cell search requirements for RedCap in TS 38.133 [6] clauses 9.2B.5.1 and 9.2B.5.2.

17.6.1.1.2 Test applicability

This test applies to all types of NR RedCap UE from release 17 onwards.

17.6.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 17.6.1.0.1 and 17.6.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.1.1.

17.6.1.2.4.2 Test procedure

Same as the test procedure given in clause 7.6.1.2.4.2 with following exceptions:

6. UE shall transmit a *MeasurementReport* message triggered by Event A3. If the overall delays measured from the beginning of time period T2 is less than X ms for sub-test 1 or less than Y ms for sub-test 2 then the number of successful tests is increased by one. If the UE fails to report the event within the overall delays measured requirement, then the number of failure tests is increased by one. Where X is

- 7202 for UE supporting power class 1 or 5,
- 4322 for UE supporting power class 2, 3, 4 or 7.

and Y is

- 51202 for UE supporting power class 1 or 5,
- 30722 for UE supporting power class 2, 3, 4 or 7.

17.6.1.2.4.3 Message contents

Same as the message contents given in clause 7.6.1.2.4.3.

17.6.1.2.5 Test requirement

Same as the test requirements given in clause 7.6.1.2.5 with following exceptions:

- For sub-test 1, X is
  - X = 7202 for UE supporting power class 1 or 5;
  - X = 4322 for UE supporting power class 2, 3, 4 or 7.
- For sub-test 2, X is
  - X = 51202 for UE supporting power class 1 or 5;
  - X = 30722 for UE supporting power class 2, 3, 4 or 7.

17.6.1.3 NR SA FR2 event triggered reporting with gap in non-DRX for 2 Rx UE

Editor's Note:

This test case is complete for the following configurations:

- UE PC3
- Test frequencies f ≤ 40.8 GHz;

This test case is incomplete for UE power classes other than PC3;

This test case is incomplete for test frequencies f > 40.8 GHz.

17.6.1.3.1 Test purpose

The purpose of this test is to verify UE's ability to make a correct reporting of an event with gaps under non-DRX within intra-frequency cell search with gaps requirements. This test will partly verify the TDD intra-frequency cell search requirements in TS 38.133 [6] clauses 9.2B.6.1 and 9.2B.6.2.

17.6.1.3.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards supporting CSI-RS based RLM and BWP operation without bandwidth restriction.

17.6.1.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 17.6.1.0.1 and 17.6.1.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.1.3.

17.6.1.3.4 Test description

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The general and cell specific test parameters for PCell and neighbour cell are given in Table 17.6.1.3.4.1-3, Table 17.6.1.3.5-1 and Table 17.6.1.3.5-2, respectively. In the measurement configuration a measurement object is configured for the frequency of the PCell and indicates to the UE that event-triggered reporting with Event A3 is used.

17.6.1.3.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 17.6.1.3.4.1-1.

Table 17.6.1.3.4.1-1: Supported test configurations

Test Case ID	Description
17.6.1.3-1	120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode
17.6.1.3-2	240 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Configure the test equipment and the DUT according to the parameters in Table 17.6.1.3.4.1-2.

17.6.1.3.4.2 Test procedure

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

There are two BWPs configured in Cell 1, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 1. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to T1 in Table 17.6.1.3.5-1.

3. Set NR Cell 2 physical cell identity = (current NR Cell 2 physical cell identity + 3) mod 1008 for current iteration of the test procedure loop.

4. SS shall transmit an *RRCReconfiguration* message to configure RedCap-specific dedicated BWP and Event A3 triggered reporting.

5. The UE shall transmit an *RRCReconfigurationComplete* message. T1 starts upon the SS receives the *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 17.6.1.3.5-1. T2 starts.

7. The SS increases the number of successful tests by one if the UE transmits a *MeasurementReport* message triggered by event A3 satisfying the overall delay requirement specified in clause 17.6.1.3.5, otherwise the SS increases the number of failure tests by one.

8. After the SS receive the *MeasurementReport* message in step 7) or when T2 expires, the SS shall:

   - transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources

   or

   - switch the UE off.

9. Depending on the choice in step 8, the SS shall,

   - transmit in NR Cell 1 a *Paging* message including matched ng-5G-S-TMSI for the UE if an *RRCRelease* has been sent in step 8. If the paging fails, switches off and on the UE,

   or

   - switch on the UE if the UE is switched off in step 8.

10. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

11. Repeat steps 2-10 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Time multiplexing of the downlink transmissions from each AoA			Defined in Figure 17.6.1.3.5-1			

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 4: Information about types of UE beam is given in TS 38.133 [6] clause B.2.1.3 and does not limit UE implementation or test system implementation.

Note 5: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [3] Table 6.2.1.3-4.

The overall delay is measured from the beginning of time period T2 to the time that the SS receives the first *MeasurementReport* message triggered by event A3. It is allowed to be up to 2 x TTI_{DCCH} higher than the measurement reporting delay specified in TS 38.133 [6] clause 9.2B.4 due to the TTI insertion uncertainty of the measurement report in DCCH.

Then the overall delay shall be no larger than: $T_{identify_intra_without_index}$ + 2 x TTI_{DCCH}, where

- $T_{identify_intra_without_index}$ = 3200 ms for UE supporting power class 1 or 5 and 1920 ms for UE supporting power class 2, 3, 4 or 7, is the time for intra-frequency cell identification specified in TS 38.133 [6] clause 9.2B.5.1,

- TTI_{DCCH} = 1 ms.

Which gives a total of 3202 ms for UE supporting power class 1 or 5 and 1922 ms for UE supporting power class 2, 3, 4 or 7.

The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

17.6.1.4 NR SA FR2 event triggered reporting with gap in DRX for 2 Rx UE

Editor's Note:

This test case is complete for the following configurations:

- UE PC3
- Test frequencies f ≤ 40.8 GHz;

This test case is incomplete for UE power classes other than PC3;

- This test case is incomplete for test frequencies f > 40.8 GHz.

17.6.1.4.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the TDD intra-frequency cell search requirements in TS 38.133 [6] clauses 9.2B.6.1 and 9.2B.6.2.

17.6.1.4.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards supporting CSI-RS based RLM, BWP operation without bandwidth restriction and long DRX cycle.

17.6.1.4.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 17.6.1.0.1 and 17.6.1.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.1.4.

Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: Information about types of UE beam is given in TS 38.133 [6] clause B.2.1.3 and does not limit UE implementation or test system implementation.
Note 5: Calculation of Es/Iot_{BB} includes the effect of UE internal noise up to the value assumed for the associated Refsens requirement in clause 7.3.2 of TS 38.101-2 [3], and an allowance of 1 dB for UE multi-band relaxation factor ΔMB_P from TS 38.101-2 [3] Table 6.2.1.3-4.

17.6.2 Inter-frequency measurements for RedCap

17.6.2.0 Minimum conformance requirements

The requirements in clause 17.6.2.0 apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap UE:
  - SS-RSRP related side conditions given in TS 38.133 [6] clauses 10.1.4 and 10.1.5 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in TS 38.133 [6] clauses 10.1.9 and 10.1.10 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in TS 38.133 [6] clauses 10.1.14 and 10.1.15 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to TS 38.133 [6] Annex B.2.3 for a corresponding band.

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index_RedCap}$.

$$T_{identify_inter_without_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap})\ ms$$

$$T_{identify_inter_with_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap} + T_{SSB_time_index_inter_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_inter_RedCap}$: it is the time period used in PSS/SSS detection given in table 17.6.2.0-1.

$T_{SSB_time_index_inter_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in table 17.6.2.0-2.

$T_{SSB_measurement_period_inter_RedCap}$: equal to a measurement period of SSB based measurement given in table , table 17.6.2.0-3, table.

For 2 Rx RedCap UE:

$M_{pss/sss_sync_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_inter_RedCap}$ = 64 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{pss/sss_sync_inter_RedCap}$ = 40 samples.

$M_{SSB_index_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{SSB_index_inter_RedCap}$ = 40 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{SSB_index_inter_RedCap}$ = 24 samples.

$M_{meas_period_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter_RedCap}$ = 64 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{meas_period_inter_RedCap}$ = 40 samples.

$CSSF_{inter_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in TS 38.133 [6] clause 9.1A.5.2 for measurement conducted within measurement gaps.

DRX cycle > 320 ms	$M_{SSB_index_inter_RedCap} \times \text{DRX cycle} \times CSSF_{inter_RedCap}$
NOTE 1: DRX or non-DRX requirements apply according to the conditions described in clause 3.6.1.	

When measurement gaps are provided for inter-frequency measurements, the RedCap UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in TS 38.133 [6] clauses 10.1A.4, 10.1A.5, 10.1A.8, 10.1A.9, 10.1A.12 and 10.1A.13, respectively, as shown in table 17.6.2.0-3.

DRX cycle > 320 ms	$M_{meas_period_inter_RedCap} \times \text{DRX cycle} \times CSSF_{inter_RedCap}$
NOTE 1: DRX or non-DRX requirements apply according to the conditions described in clause 3.6.1.	

For 2 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in TS 38.133 [6] clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. Both $T_{identify_inter_without_index_RedCap}$ and $T_{identify_inter_with_index_RedCap}$ are defined in TS 38.133 [6] clause 9.3B.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_inter_without_index_RedCap}$ or $T_{identify_inter_with_index_RedCap}$ as defined in TS 38.133 [6] clauses 9.3B.4 or 9.3B.7.1. If a cell which has been detectable at least for the time period $T_{identify\ inter\ without\ index_RedCap}$ or $T_{identify\ inter\ with\ index_RedCap}$ defined in TS 38.133 [6] clauses 9.3B.4 or 9.3B.7.1 becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where μ is the SCS configuration as defined in clause 4.2 of TS 38.211 [7]. When L3 filtering is used, an additional delay can be expected.

The normative reference for this requirement is TS 38.133 [6] clauses 9.3B.2, 9.3B.4, 9.3B.5 and 9.3B.6.3.

17.6.2.1 NR SA FR2-FR2 event triggered reporting in non-DRX for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- This test case is incomplete for UE power classes other than PC3 (e.g. PC7).
- This test case is incomplete for test frequencies > 40.8 GHz.

17.6.2.1.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements for RedCap in TS 38.133 [6] clause 9.3B.4.

17.6.2.1.2 Test applicability

This test applies to all types of NR RedCap UE from release 17 onwards.

17.6.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.6.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.2.1.

17.6.2.3 NR SA FR2-FR2 event triggered reporting with SSB time index detection in non-DRX for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- This test case is incomplete for UE power classes other than PC3 (e.g. PC7).
- This test case is incomplete for test frequencies > 40.8 GHz.

17.6.2.3.1 Test purpose

To verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements for RedCap in TS 38.133 [6] clause 9.3B.4.

17.6.2.3.2 Test applicability

This test applies to all types of NR RedCap UE from release 17 onwards.

17.6.2.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.6.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.2.3.

Editor's Notes:

This test case has been completed for the following configurations:

- Test frequencies f ≤ 40.8 GHz
- UE PC3

This test case is incomplete for UE power classes other than PC3

This test case is incomplete for Test frequencies f > 40.8 GHz

17.6.3.3.1 Test purpose

To verify that the UE makes correct reporting of L1-RSRP measurement. This test will partly verify the L1-RSRP measurement requirements in TS 38.133 [6] clause 9.5B.4.2.

17.6.3.3.2 Test applicability

This test applies to all types of NR RedCap UEs from Release 17 onwards.

17.6.3.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.6.3.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.3.3.

17.6.4 NR Measurements with autonomous gaps for RedCap

17.6.4.0 Minimum conformance requirements

17.6.4.0.1 Minimum conformance requirements for CGI identification of an NR cell with autonomous gaps

The UE shall identify and report the CGI of a known NR target cell when requested by the network for the purpose of *reportCGI*. Only one cell is provided to the UE with *cellForWhichToReportCGI* for identifying the CGI.The UE may make autonomous gaps in both downlink reception and uplink transmission for receiving *MIB* and *SIB1* message according to clause 5.5.3 of TS 38.331 [13]. Note that a UE is not required to use autonomous gap if *useAutonomousGaps* is set to false. If autonomous gaps are used for measurement with the purpose of *reportCGI*, regardless of whether DRX is used or not, the UE shall be able to identify a new CGI of NR cell within:

$$T_{identify_CGI_redcap} = (T_{MIB_redcap} + T_{SIB1_redcap})\ ms$$

Where:

T_{MIB_redcap} is the time period used to acquire *MIB* message. $T_{MIB_redcap} = 25 * T_{SMTC}$ ms for target cell carrier frequency on FR2.

T_{SIB1_redcap} is the time period used to acquire *SIB1* message. $T_{SIB1_redcap} = 6 * T_{RMSI\text{-}scheduling}$ ms.

Where T_{SMTC} is the SMTC periodicity configured for the target cell measurement, and $T_{RMSI\text{-}scheduling}$ is

- the periodicity with which the *SIB1* is actually transmitted by the NR target cell when SSB and RMSI CORESET multiplexing pattern is 1.

- the maximum between the periodicity with which the *SIB1* is actually transmitted by the NR target cell and T_{SMTC} when SSB and RMSI CORESET multiplexing pattern is 2 or 3. The requirement for identifying the CGI of an NR cell within $T_{identify_CGI_redcap}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [13] is used.

In the requirement a cell is known if,

- During the last 5 seconds for FR1 or 3 seconds for FR2 before the reception of the report CGI command:
  - The UE has sent a valid L3-RSRP measurement report with SSB index for the target cell and.

- During *MIB* decoding at least reported SSBs remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133 [6], and
- During *SIB1* decoding the SSB used for *MIB* decoding remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133 [6], and
- During *MIB* decoding, the SSB for *MIB* decoding remains detectable with SNR $\geqslant$-3 dB
- During *SIB1* decoding, the PDSCH for *SIB1* decoding remains detectable with SNR $\geqslant$-3 dB

The CGI reporting delay is defined as the time between a command that will trigger a CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x TTI_{DCCH} resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI_redcap}$ plus RRC procedure delay defined in clause 12 in TS 38.331 [13], and additional 20 ms margin if target cell is on FR2.

When a RedCap UE is identifying CGI of an NR cell with autonomous gaps, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on PCell for the following slots:

- with up to K1 interruptions with interrupted slots up to X1 specified in Table 17.6.4.0.1-1 for each interruption during *MIB* decoding time period T_{MIB_redcap} (ms).
- with up to L1 interruptions with interrupted slots up to Y1 specified in Table 17.6.4.0.1-1 during *SIB1* decoding time period T_{SIB1_redcap} (ms) for SSB and CORESET for RMSI scheduling multiplexing patterns 1.
- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in Table 17.6.4.0.1-1 during *SIB1* decoding time period T_{SIB1_redcap} (ms) for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 25 for the target cell carrier frequency on FR2, and
- L1 = T_{SIB1_redcap} /20 and
- L2 = T_{SIB1_redcap} /T_{SMTC}, where T_{SMTC} is the periodicity of the SMTC occasion configured for the target cell carrier.

Table 17.6.4.0.1-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps

μ	NR Slot length (ms) of victim cell	Interruption length X1 (slots)	Interruption length Y1 (slots)	Interruption length Y2 (slots)

17.6.4.1 NR SA FR2-FR2 CGI identification of NR neighbour cell for 2 Rx UE

Editor's note: This test case is incomplete in following aspects:

- TT analysis is still missing.

17.6.4.1.1 Test purpose

To verify that the UE makes correct reporting of an CGI. This test will partly verify the SA inter-frequency NR cell search requirements in TS 38.133 [6] clause 9.11A.

17.6.4.1.2 Test applicability

This test applies to all types of NR RedCap UE with 2 Rx from Release 17 onwards supporting FR2 and acquisition of CGI from neighbour NR cell using autonomous gap.

17.6.4.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.6.4.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.17.6.4.1.

17.6.4.1.4 Test description

The test scenario comprises of two NR carriers and two NR cells: NR Cell 1 as PCell in FR2 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR2 on NR RF channel 2.

The test consists of three successive time periods, with time durations of T1 and T2 respectively:

- Measurement gap patterns are configured. During T1 the UE shall report event A3 for Cell 2. Within 3 seconds of the event report, the test equipment shall add a measurement reporting configuration using *ReportConfigNR* which contains a *ReportCGI* IE with *cellForWhichToReportCGI* set to the physical Cell ID of Cell 2 and including the optional IE *useAutonomousGaps-r16*.

- Time period T2 begins 10 ms after the test equipment has transmitted the *RRCreconfiguration* message containing the *ReportCGI* IE.

17.6.4.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 17.6.4.1.4.1-1.

Table 17.6.4.1.4.1-1: Supported test configurations

Test equipment shall configure CGI reporting within 3 s after receiving the event A3 report. T2 begins 10 ms after test equipment has transmitted the *RRCreconfiguration* to configure CGI reporting.
T2	s	1	

17.6.4.1.4.2 Test procedure

Throughout the test, the UE shall be scheduled to perform DL reception on every slot suitable for DL.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell.

2. Set the parameters according to T1 in Table 17.6.4.1.5-1 and Table 17.6.4.1.5-2. T1 starts.

3. The SS transmits an *RRCReconfiguration* message to configure event A3 triggered measurement reporting on NR Cell 2.

4. The UE transmits an *RRCReconfigurationComplete* message.

5. UE transmits a *MeasurementReport* message triggered by Event A3.

6. Within 3 seconds after receiving *MeasurementReport* message in step 5, the SS transmits an *RRCReconfiguration* message to configure an autonomous gap based CGI measurement reporting on NR Cell 2.

7. The start of T2 is the instant 10 ms after the last TTI containing the *RRCReconfiguration* message in step 6 is sent to the UE, at that instant the SS shall switch the power setting from T1 to T2 as specified in Tables 17.6.4.1.5-1 and 17.6.4.1.5-2.

8. If the UE

   a) transmits a *MeasurementReport* message containing CGI of NR Cell 2 less than 645 ms from the beginning of time period T2, and

b) has missed no more than 1240 ACK/NACKs from the start of T2 until 645 ms,

then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

9. Set Cell 2 physical cell identity = ((current Cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
Note 5: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.
Note 6: As observed with 0 dBi gain antenna at the centre of the quiet zone.
Note 7: Information about types of UE beam is given in TS 38.133 [6] Annex B.2.1.3, and does not limit UE implementation or test system implementation.

The UE shall transmit a measurement report containing the cell global identifier of Cell 2 within overall delay from the start of T2, where the overall delay is calculated as follows,

Overall delay = RRC procedure delay + $T_{identify_CGI_RedCap}$ + additional margin for FR2 + TTI insertion uncertainty

- RRC procedure delay = 10 ms, is the RRC procedure delay specified in TS 38.331 [13] clause 12;
- $T_{identify_CGI_RedCap} = T_{MIB_redcap} + T_{SIB1_redcap}$
  - T_{MIB_redcap} = 500 ms, is the time period used to acquire *MIB* message;
  - T_{SIB1_redcap} = 120 ms, is the time period used to acquire *SIB1* message;
- TTI insertion uncertainty = 2 x TTI_{DCCH} = 2 ms, is the delay uncertainty when inserting the measurement report to the TTI of the uplink DCCH;
- additional margin for FR2 = 20 ms, is specified in TS 38.133 [6] clause 9.11A.3

Which gives overall delay = 10 + 500 + 120 + 20 + 2 = 652 ms, allow 655 ms.

From the start of T2 until 655 ms. The number of missed ACK/NACK shall be no more than the maximum number of missed ACK/NACK given in Table 17.6.4.1.5-2.

The rate of correct events observed during repeated tests shall be at least 90%.

Table 17.6.4.1.5-2: Maximum number of missed ACK/NACKs during the overall delay

Test config.	Maximum number of missed ACK/NACKs
1	1240 Note 1
NOTE 1: The overall missed ACK/NACK number is caused by two parts. Firstly, up to 25 interruptions, each has a length of up to 48 slots, are allowed during T_{MIB_redcap} as specified in TS 38.133 [6] Table 9.11A.4-1. Secondly, up to 6 interruptions, each has a length of up to 49 slots are allowed during T_{SIB1_redcap} as specified in TS 38.133 [6] Table 9.11A.4-1 assuming SSB/CORESET0 multiplxing pattern #0. In worst case, they will cause up to ceil(48/5)*4*25 + ceil(49/5)*4*6 = 1240 missed ACK/NACKs (assuming TDDConf.3.1 is used).

17.7.2.1 NR SA FR2 SS-RSRQ measurement accuracy for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- Normal conditions.
- The test is incomplete for UE power classes other than PC3.
- The test is incomplete for test frequencies > 40.8 GHz.
- The test is incomplete for extreme conditions.

17.7.2.1.1 Test purpose

To verify that the intra-frequency SS-RSRQ measurement accuracy is within the specified limits for all bands.

17.7.2.1.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards.

17.7.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 17.7.2.0.1.

17.7.3.2 NR SA FR2 CSI-RS based L1-RSRP measurement accuracy for 2 Rx UE

Editor's note: This test case has been completed for the following configurations:

- Test frequency f ≤ 40.8 GHz.
- UE PC3.
- Normal conditions.
- The test is incomplete for UE power classes other than PC3.

- The test is incomplete for test frequencies > 40.8 GHz.
- The test is incomplete for extreme conditions.

17.7.3.2.1 Test purpose

To verify that the CSI-RS based L1-RSRP absolute measurement accuracy is within the specified limits for all bands.

17.7.3.2.2 Test applicability

This test applies to all types of NR RedCap UE from Release 17 onwards.

17.7.3.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clauses 17.7.3.0.3 and 17.7.3.0.4.

The normative reference for this requirement is TS 38.133 [6] clause A.17.7.3.2.

Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 2: SS-SINR, SSB_RP, and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 3: SS-SINR and SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 4: Equivalent power received by an antenna with 0 dBi gain at the centre of the quiet zone.

Note 5: As observed with 0 dBi gain antenna at the centre of the quiet zone.

Note 6: Information about types of UE beam is given in Annex B.2.1.3 of TS 38.133 [6] and does not limit UE implementation or test system implementation.

18 E-UTRA - NR inter-RAT with E-UTRA serving cell for RedCap

18.1 RRC_IDLE state mobility for RedCap

18.1.1 Inter-RAT cell re-selection for RedCap

18.1.1.0 Minimum conformance requirements

[TS 36.133 [23] clause 4.2.1]

When the UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. UE measurement activity is also controlled by measurement rules defined in TS 36.304 [1], allowing the UE to limit its measurement activity.

[TS 36.133 [23] clause 4.2.2]

The UE shall search every layer of higher priority at least every $T_{higher_priority_search}$ = (60 * N_{layers}) seconds when the UE is not configured with eDRX_IDLE cycle, and at least every $T_{higher_priority_search}$ = MAX(60 * N_{layers}, one eDRX_IDLE cycle) when UE is configured with eDRX_IDLE cycle, where N_{layers} is the total number of configured higher priority E-UTRA, UTRA FDD, UTRA TDD, CDMA2000 1x, HRPD and NR carrier frequencies and is additionally increased by one if one or more groups of GSM frequencies is configured as a higher priority.

[TS 36.133 [23] clause 4.2.2.5.8]

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-RAT NR layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-RAT NR layers of higher, lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT NR layers shall be the same as that defined below for lower priority RATs.

The requirements in this section apply for inter-RAT NR measurements. When the measurement rules indicate that inter-RAT NR cells are to be measured, the UE shall measure SS-RSRP and SS-RSRQ of detected NR cells in the neighbour frequency list at the minimum measurement rate specified in this section. The parameter $N_{NR_carrier_RedCap}$ is the total number of configured NR carriers in the neighbour frequency list. The UE shall filter SS-RSRP and SS-RSRQ

measurements of each measured NR cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least half the minimum specified measurement period.

The UE shall be able to evaluate whether a newly detectable inter-RAT NR cell meets the reselection criteria defined in TS 36.304 [1] within ($N_{NR_carrier_RedCap}$) * $T_{detectNR_RedCap}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least 5 dB in FR1 or 6.5 dB in FR2 for reselections based on ranking or 6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities or 4 dB in FR1 and 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_RedCap}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this section shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects on an inter-RAT NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT NR cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

Cells which have been detected shall be measured at least every ($N_{NR_carrier_RedCap}$) * $T_{measureNR_RedCap}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$.

For a cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that an already identified inter-RAT NR cell has met reselection criterion defined in TS 36.304 [1] within ($N_{NR_carrier_RedCap}$) * $T_{evaluateNR_RedCap}$ when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least 5dB in FR1 or 6.5 dB in FR2 for reselections based on ranking or 6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities or 4 dB in FR1 and 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities.

For UE not configured with eDRX_IDLE cycle, T_{detect,NR_RedCap}, $T_{measure,NR_RedCap}$ and $T_{evaluate,NR_RedCap}$ are specified in Table 18.1.1.0-1 .

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, T_{detect,NR_RedCap}, $T_{measure,NR_RedCap}$ and $T_{evaluate,NR_RedCap}$ are specified in Table 18.1.1.0-1 and Table 18.1.1.0-1 for FR1 and FR2 respectively.

If $T_{reselection}$ timer has a non-zero value and the inter-RAT NR cell is satisfied with the reselection criteria which are defined in TS 36.304 [1], the UE shall evaluate this NR cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

NOTE 1: The number of DRX cycles in this table is given for the DRX cycles within PTWs.
NOTE 2: The eDRX_IDLE cycle lengths are as specified in Section 10.5.5.32 of TS 24.008 [34].
NOTE 3: Number of eDRX cycles when eDRX_IDLE cycle length equals, 5.12s. Otherwise, number of DRX cycles.
NOTE 4: M2 = 1.5 if SMTC periodicity of measured Inter-RAT NR cell > 20 ms; otherwise M2=1. If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the Inter-RAT NR carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the Inter-RAT NR carrier, longer T_{detect, NR_intra} is expected.

18.1.1.1 E-UTRA - NR SA FR1 E-UTRA cell re-selection to higher priority NR target Cell for 2 Rx UE

18.1.1.1.1 Test purpose

The purpose of this test is to verify the requirement for the E-UTRA - NR SA FR1 inter-RAT cell reselection for RedCap UEs.

18.1.1.1.2 Test applicability

This test applies to all types of NR RedCap UE release 17 and forward.

18.1.1.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 18.1.1.0.

The normative reference for this requirement is TS 38.133 [6] clause A.18.1.1.1.

18.1.1.1.4 Test description

18.1.1.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 18.1.1.1.4.1-1.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The cell reselection delay to a higher priority NR cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search} + T_{evaluate, NR} + T_{SI-NR,}$ and to a lower priority cell can be expressed as: $T_{evaluate, NR} + T_{SI-NR,}$

The rate of correct events observed during repeated tests shall be at least 90% with the confidence level of 95%.

18.2.2 RRC connection release with redirection for RedCap

18.2.2.0 Minimum conformance requirements

18.2.2.0.1 Redirection from E-UTRA to FR1 RedCap UE

The RedCap UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR_RedCap}$.

The time delay ($T_{connection_release_redirect_NR_RedCap}$) is the time between the end of the last TTI containing the RRC command, "*RRCConnectionRelease*" (TS 36.331 [2]) on the E-UTRAN PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR_RedCap}$) shall be less than:

$$T_{connection_release_redirect_NR_RedCap} = T_{RRC_procedure_delay} + T_{identify\text{-}NR_Redcap} + T_{SI\text{-}NR_RedCap} + T_{RACH_RedCap}$$

The target NR cell shall be considered detectable for 1 Rx RedCap when for each relevant SSB:

- SSB_RP and SSB $\hat{E}s/Iot$ according to Annex B.2.X of TS 38.133 [6] for a corresponding NR Band.

The target NR cell shall be considered detectable for 2 Rx RedCap when for each relevant SSB:

- SSB_RP and SSB $\hat{E}s/Iot$ according to Annex B.2.X of TS 38.133 [6] for a corresponding NR Band.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCConnectionRelease*" as defined in clause 6.2.2 of TS 36.331 [2]. It shall be less than 110 ms.

$T_{identify\text{-}NR_RedCap}$: It is the time to identify the target NR cell and depends on the frequency range (FR) of the target NR cell. It is defined in Table 18.2.2.0-1 for 1 Rx RedCap for FR1 and in Table 18.2.2.0-2 for 2 Rx RedCap. $T_{identify\text{-}NR_RedCap} = T_{PSS/SSS\text{-}sync_RedCap} + T_{meas_RedCap}$, where $T_{PSS/SSS\text{-}sync_RedCap}$ is the cell search time and T_{meas_RedCap} is the measurement time due to cell selection criteria evaluation. The RedCap UE operating in NR HD-FDD shall meet the requirements in this section provided that the SSB is available at the UE at least once every SMTC period during $T_{identify\text{-}NR_RedCap}$.

$T_{SI\text{-}NR_RedCap}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

T_{RACH_RedCap}: It is the delay caused due to the random access procedure when sending random access to the target NR cell. T_{RACH_RedCap} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [39]. The RedCap UE operating in NR HD-FDD mode shall perform the PRACH transmission on the PRACH resource of the target NR cell provided that the UE has received at least one SSB associated with the PRACH resource during the last [TBD] period in the target NR cell.

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise T_{rs} is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this section is applied with T_{rs} = 20 ms assuming the SSB transmission periodicity is not larger than 20 ms,
- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

Frequency range (FR) of target NR cell	$T_{identify-NR_RedCap}$
FR1	MAX (680 ms, 12 x Trs)

18.2.2.1 E-UTRA - NR SA FR1 RRC connection release with redirection for 2 Rx UE

18.2.2.1.1 Test purpose

To verify RRC connection release with redirection from E-UTRA to NR requirements for 2Rx RedCap specified in TS 36.133 [23] clause 6.3.2.6.

18.2.2.1.2 Test applicability

This test applies to all types of NR RedCap UE with 2Rx from Release 17 onwards.

18.2.2.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 18.2.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clauses A.18.2.2.1.

18.2.2.1.4.2 Test procedure

The test consists of two successive time periods, with time duration of T1, and T2 respectively. The *RRCConnectionRelease* message shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2.

1. Ensure the UE is in State 3A-RF according to TS 36.508 [25] clause 7.2A.3.

2. Set the parameters according to T1 in Table 18.2.2.1.5-1 for Cell 1 and Table 18.2.2.1.5-2 for Cell 2. T1 starts.

3. SS shall transmit an *RRCConnectionRelease* with *redirectedCarrierInfo* during period T1.

4. The SS shall start T2 timer when the last TTI containing the *RRCConnectionRelease* message is sent to UE.

5. When T2 starts, the SS shall switch the power setting from T1 to T2 as specified in Table 18.2.2.1.5-1 for Cell 1 and in Table 18.2.2.1.5-2 for Cell 2.
6. The UE shall transmit an *RRCSetupRequest* message.
7. If the UE transmits the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
8. After T2 expires, the UE shall be switched off. Then ensure the UE is in State 3A-RF according to TS 36.508 [25] clause 7.2A.3. Cell 1 is the active cell and Cell 2 shall be powered OFF.
9. The SS shall set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.
10. Repeat step 2-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The UE shall start to transmit the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2.
The rate of correct RRC connection release redirection to NR observed during repeated tests shall be at least 90%.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_NR_RedCap} = T_{RRC_procedure_delay} + T_{identify\text{-}NR_Redcap} + T_{SI\text{-}NR_RedCap} + T_{RACH_RedCap}$$

where:

$T_{RRC_procedure_delay}$ = 110 ms and is specified in clause 12 in TS 38.331 [13].

$T_{identify\text{-}NR}$ = 680 ms in the test.

$T_{SI\text{-}NR_RedCap}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 38.331[13] for the target NR cell.

T_{RACH_RedCap} = 170 ms in the test.

This gives a total of 2240 ms.

18.3 Measurement procedure for RedCap

18.3.1 E-UTRA - NR Measurements for RedCap

18.3.1.0 Minimum conformance requirements

18.3.1.0.1 Minimum conformance requirements for E-UTRA - NR event-triggered measurement

The UE shall be able to identify new inter-RAT NR cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-RAT cells if carrier frequency information is provided by the PCell, even if no explicit neighbour list with physical layer cell identities is provided.

Requirements in this clause are applicable to both E-UTRA FDD and E-UTRA TDD serving cell.

When measurement gaps are scheduled, the RedCap UE shall be able to identify a new detectable cell within $T_{identify_irat_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise, UE shall be able to identify a new detectable inter-RAT cell within $T_{identify_irat_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-RAT SS block of an already detected cell within $T_{identify_irat_without_index_RedCap}$.

$$T_{identify_irat_without_index_RedCap} = (T_{PSS/SSS_sync_irat_RedCap} + T_{SSB_measurement_period_irat_RedCap}) \text{ ms}$$

$$T_{identify_irat_with_index_RedCap} = (T_{PSS/SSS_sync_irat_RedCap} + T_{SSB_measurement_period_irat_RedCap} + T_{SSB_time_index_irat_RedCap}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_irat_RedCap}$: it is the time period used in PSS/SSS detection given in Table 18.3.1.0.1-1 and Table 18.3.1.0.1-3 for 2 Rx RedCap, Table 18.3.1.0.1-2 for 1 Rx RedCap.

$T_{SSB_time_index_irat_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in Table 18.3.1.0.1-4 and Table 18.3.1.0.1-6 for 2 Rx RedCap, Table 18.3.1.0.1-5 for 1 Rx RedCap.

$T_{SSB_measurement_period_irat_RedCap}$: equal to a measurement period of SSB based measurement given in Table 18.3.1.0.1-7 and Table 18.3.1.0.1-9 for 2 Rx RedCap, Table 18.3.1.0.1-8 for 1 Rx RedCap.

$M_{pss/sss_sync_irat_RedCap}$: For a 2 Rx RedCap supporting FR2 power class 7, $M_{pss/sss_sync_irat_RedCap}$ = 40 samples.

$M_{SSB_index_irat_RedCap}$: For a 2 Rx RedCap supporting FR2 power class 7, $M_{SSB_index_irat_RedCap}$ = 40 samples.

$M_{meas_period_irat_RedCap}$: For a 2 Rx RedCap supporting FR2 power class 7, $M_{meas_period_irat}$ = 40 samples.

N_{freq_RedCap} is defined in TS 38.133 [6] clause 8.1.2.1.1d.

NOTE 1: DRX or non DRX requirements apply according to the conditions described in section 3.6.1 of TS 38.133 [50].	

In the requirements, an NR cell is considered detectable when:

- NR SS-RSRP related conditions in the accuracy requirements in Section 9.11.x are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 of TS 38.133 [50],
- NR SS-RSRQ related conditions in the accuracy requirements in Section 9.11.y are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 of TS 38.133 [50],
- NR SS-SINR related conditions in the accuracy requirements in Section 9.11.z are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 of TS 38.133 [50].

The RedCap UE operating in NR HD-FDD shall meet the current PSS/SSS detection requirements provided that at least 5 SMTC windows are available at the UE during the PSS/SSS detection time.

The RedCap UE operating in NR HD-FDD shall meet the current time index detection requirements provided that at least 3 SMTC windows are available at the UE during the time index detection time.

When measurement gaps are scheduled for NR measurements the UE physical layer shall be capable of reporting NR SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clause 9.11, with measurement period as shown in table 8.20.2.1-5 and 8.20.2.1-6 for 2Rx UE, table 8.20.2.1-5a for 1Rx UE:

NOTE 1: DRX or non DRX requirements apply according to the conditions described in section 3.6.1 of TS 38.133 [50].	

The RedCap UE operating in NR HD-FDD shall meet the current measurement requirements provided that at least 5 SMTC windows are available at the UE during the measurement period.

Reported measurements in event triggered measurement reports shall meet the requirements in clause 9.

The UE shall not send any event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The measurement reporting delay is defined as the time between any event that will trigger a measurement report until the UE starts to transmit the measurement report over the Uu interface. This requirement assumes that the measurement

report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify_irat_without_index_RedCap}$ or $T_{identify_irat_with_index_RedCap}$ for the minimum requirements.

If an NR cell which has been detectable at least for the time period $T_{identify_irat_without_index_RedCap}$. or $T_{identify_irat_with_index_RedCap}$ defined in clause 8.20.2.1 for the minimum requirements and then triggers the measurement report as per TS 36.331 [2], the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_irat_RedCap}$ defined in clause 8.20.2.1 provided the timing to that cell has not changed more than ±3200 Tc while measurement gap has not been available and the L3 filter has not been used.

18.3.1.1 E-UTRA - NR SA FR1 event triggered reporting without SSB time index detection in non-DRX

18.3.1.1.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

18.3.1.1.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx.

18.3.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.1.

18.3.1.2 E-UTRA - NR SA FR1 event triggered reporting without SSB time index detection in DRX

18.3.1.2.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

18.3.1.2.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards supporting NR RedCap with 2Rx and long DRX cycle.

18.3.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.2.

18.3.1.4 E-UTRA - NR SA FR1 event triggered reporting with SSB time index detection in DRX

18.3.1.4.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

18.3.1.4.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards supporting NR RedCap with 2Rx and long DRX cycle.

18.3.1.4.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 18.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.18.3.1.4.

18.3.1.5 E-UTRA - NR SA FR2 event triggered reporting without SSB time index detection in non-DRX

Editor's Notes: This test case is incomplete:

- E-UTRA – NR FR2 testability issue is not cleared.
- The TT analysis is complete for test frequencies f ≤ 40.8 GHz
- The TT analysis is complete for UE PC3
- This test case is incomplete for UE power classes other than PC3
- This test case is incomplete for Test frequencies f > 40.8 GHz

18.3.1.5.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

18.3.1.5.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx. Test 1 applies to UEs not supporting per-FR gap and test 2 applies only to UEs supporting per-FR gap.

18.3.1.5.3 Minimum conformance requirements

18.3.1.7 E-UTRA - NR SA FR2 event triggered reporting with SSB time index detection in non-DRX

Editor's Notes: This test case is incomplete:

- E-UTRA – NR FR2 testability issue is not cleared.
- The TT analysis is complete for test frequencies f ≤ 40.8 GHz
- The TT analysis is complete for UE PC3
- This test case is incomplete for UE power classes other than PC3
- This test case is incomplete for Test frequencies f > 40.8 GHz

18.3.1.7.1 Test purpose

To verify that the RedCap UE makes correct reporting of an event. This test will partly verify the NR inter-RAT cell search requirements in clause TS 36.133 [23] clause 8.20.2 for E-UTRAN FDD-NR measurements and TS 36.133 [23] clause 8.20.3 for E-UTRAN TDD-NR measurements.

18.3.1.7.2 Test applicability

This test applies to all E-UTRA UE from release 17 onwards and capable of NR RedCap with 2Rx. Test 1 applies to UEs not supporting per-FR gap and test 2 applies only to UEs supporting per-FR gap.

18.3.1.7.3 Minimum conformance requirements

19 NR standalone tests for ATG

19.0 General

19.0.1 Initial test environment conditions for ATG RRM tests

The following initial conditions apply to all ATG RRM test cases specified in this section, unless otherwise specified in the test:

1. UE location according to TS 38.508-1 [14] clause 7.7.2 is provided to the UE through any preconfigured means.

19.1 RRC_IDLE state mobility for ATG

19.1.0 Minimum conformance requirements

19.1.0.1 Measurements of intra-frequency NR cells

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [30] within T_{detect,NR_Intra} when that $T_{reselection}$= 0 . An intra-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.2 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra}$ (see table 19.1.0.1-1) for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra}$/2.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS 38.304 [30] within $T_{evaluate,NR_Intra}$ when $T_{reselection}$ = 0 as specified in table 19.1.0.1-1 provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 3 dB better ranked in FR1.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [30] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them.
        - the cell is at least 3 dB better ranked in FR1 if the current serving cell is among them.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the intra-frequency cell is satisfied with the reselection criteria which are defined in TS 38.304 [30], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,\ NR_intra}$ are specified in table 19.1.0.1-1. The requirements in this clause apply provided that SSB of neighbour cells are within SMTC window duration.

Table 19.1.0.1-1: T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$

DRX cycle length [s]	Scaling Factor (N1)	T_{detect,NR_Intra} [s] (number of DRX cycles)	$T_{measure,NR_Intra}$ [s] (number of DRX cycles)	$T_{evaluate,NR_Intra}$ [s] (number of DRX cycles)
	FR1			

0.32	N1 Note 1	11.52 x N1 x M2 (36 x N1 x M2)	1.28 x N1 x M2 (4 x N1 x M2)	5.12 x N1 x M2 (16 x N1 x M2)
0.64		17.92 x N1 (28 x N1)	1.28 x N1 (2 x N1)	5.12 x N1 (8 x N1)
1.28		32 x N1 (25 x N1)	1.28 x N1 (1 x N1)	6.4 x N1 (5 x N1)
2.56		58.88 x N1 (23 x N1)	2.56 x N1 (1 x N1)	7.68 x N1 (3 x N1)
NOTE 1: For ATG UEs capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.				
NOTE 2: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2=1. If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.				

The normative reference for this requirement is TS 38.133 [6] clause 4.2D.2.3.

19.1.0.2 Measurements of inter-frequency NR cells

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in TS 38.133 [6] clause 4.2D.2.6.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

If at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least 5 dB in FR1 for reselections based on ranking or 6 dB in FR1 for SS-RSRP reselections based on absolute priorities or 4 dB in FR1 for SS-RSRQ reselections based on absolute priorities, the UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [30] within $K_{carrier}$ * T_{detect,NR_Inter_enh} as specified in table 19.1.0.2-2 if UE indicates support of *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes for ATG* and is configured with *hs-ATG-cellReselectionSet-r18* for FR1, otherwise the UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [30] within $K_{carrier}$ * T_{detect,NR_Inter} as specified in table 19.1.0.2-1. The parameter $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell.

An inter-frequency cell is considered to be detectable according to the conditions defined in TS 38.133 [6] Annex B.1.3 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier}$ * $T_{measure,NR_Inter}$ for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [30] within $K_{carrier} * T_{evaluate,NR_Inter}$ when $T_{reselection} = 0$ as specified in table 19.1.0.2-1, provided that the reselection criteria is met by

- the condition when performing equal priority reselection and
- when *rangeToBestCell* is not configured:
  - the cell is at least 5 dB better ranked in FR1 or.

  when *rangeToBestCell* is configured:
  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [30] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them
    - the cell is at least 5 dB better ranked in FR1 if the current serving cell is among them. or
- 6 dB in FR1 for SS-RSRP reselections based on absolute priorities or
- 4 dB in FR1 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 19.1.0.2-1 and table 19.1.0.2-2 under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where
  - T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.
  - T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.
- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [30].

The requirements in this clause apply provided that SSB of neighbour cells are within SMTC window duration.

19.2 RRC_CONNECTED state mobility

19.2.1 Handover for ATG

19.2.1.0 Minimum conformance requirements

19.2.1.0.1 Minimum conformance requirements for NR FR1 – NR FR1 handover

When the UE receives a RRC message implying handover to NR cell, the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command. $D_{handover}$ is defined as

$$D_{handover} = T_{RRC_procedure_delay} + T_{interruption}$$

Where:

$T_{RRC_procedure_delay}$: it is the RRC procedure delay, which is 10ms

$T_{interruption}$: it is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover to NR cell is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then T_{search} = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = N*T_{rs}$ ms. If the target cell is an unknown

inter-frequency cell and the target cell Es/Iot≥-2 dB, then T_{search} = 3* N*T_{rs} ms. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

For UE with one or multiple omni-directional antenna(s), N = 1;

For UE with the antenna array,

- When network assistance on ATG cells reference location of the target cell is provided to UE, N = 2;
- Otherwise, N = 4.

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. T_{Δ} = T_{rs} for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5ms assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in Clause 9.2D.5 for intra-frequency handover and Clause 9.3D.4 for inter-frequency handover.

The normative reference for this requirement is TS 38.133 [6] clause 6.1E.1.2.

19.2.1.1 Intra-frequency handover from FR1 to FR1; known target cell

Editor's note: This test case is incomplete for the following configurations:

- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.2.1.1.1 Test purpose

To verify the NR ATG UE's ability to perform NR FR1-NR FR1 intra frequency handover for ATG in RRC_CONNECTED state by meeting the delay requirement and interruption length for handover to known target cell.

19.2.1.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

19.2.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.1.1.

19.2.1.1.4 Test description

19.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

This test shall be tested using any of the test configurations in Table 19.2.1.1.4.1-1.

19.2.1.1.4.2 Test procedure

The test scenario comprises of one NR carrier and two cells as given in tables 19.2.1.1.4.1-3 and 19.2.1.1.5-1. No gap patterns are configured in the test case. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send measurement report A3. An RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message. Cell 1 is the active cell.

2. Set the parameters according to T1 in Table 19.2.1.1.5-1. Propagation conditions are set according to Annex C clause C.2.2. T1 starts.

3. SS shall transmit an RRCReconfiguration message, configuring measurement object.

4. UE shall transmit RRCReconfigurationComplete message.

5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.1.1.5-1.

6. UE shall transmit a MeasurementReport message triggered by Event A3.

7. SS shall transmit the RRCReconfiguration message implying handover is sent to the UE, at that instant the SS shall switch the power settings from T2 to T3 as specified in Table 19.2.1.1.5-1. T3 starts.

8. If the UE transmits the uplink PRACH channel to Cell 2 less than 72 ms from the beginning of time period T3 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

9. The UE shall transmit *RRCReconfigurationComplete* message on Cell 2.

10. After T3 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.

11. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 3) mod1008) for next iteration of the test procedure loop.

12. Repeat steps 2-8 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.								

The UE shall start to transmit the PRACH to Cell 2 less than 72 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{interrupt}$ = 62 ms in the test. $T_{interrupt}$ is defined in clause 19.2.1.0.1.

This gives a total of 72 ms.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.				
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.				
Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.				

The UE shall start to transmit the PRACH to Cell 2 less than 132 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{interrupt}$ = 122 ms in the test. $T_{interrupt}$ is defined in clause 6.1E.1.2.2.

This gives a total of 132 ms.

19.2.2 Conditional Handover for ATG

19.2.2.0 Minimum conformance requirements

19.2.2.0.1 Minimum conformance requirements for NR FR1 – NR FR1 conditional handover

[TS 38.133 clause 6.1E.2.2.1]

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2]. UE shall start RRM measurement before the distance condition is met if the *condEventD1* is configured to UE, the distance condition is defined in clause 5.5.4 in TS 38.331[2]. When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel within D_{CHO} seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

Where:

T_{RRC} is the RRC procedure delay defined in clause 12 in TS 38.331 [2].

T_{Event_DU} is the delay uncertainty which is the time from when the UE successfully decodes a conditional handover command until a condition exists at the measurement reference point which will trigger the conditional handover.

$T_{measure}$ is the measurements time stated in TS 38.133 [6] clause 6.1E.2.2.2.

$T_{CHO_execution}$ is the conditional execution preparation time in TS 38.133 [6] clause 6.1E.2.2.3.

$T_{interrupt}$ is the interruption time stated in TS 38.133 [6] clause 6.1E.2.2.4.

The conditional handover delay requirements are applied if both condition D1-1 and condition D1-2 are fulfilled before the end of $T_{measure}$ for location-based CHO, otherwise no CHO requirement is applied.

[TS 38.133 clause 6.1E.2.2.2]

The measurement time delay is defined from the end of T_{Event_DU} until UE executes a handover to a target cell and interruption time starts.

For intra-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify_intra_without_index}$ defined in TS 38.133 [6] clause 9.2D.5.1 or clause 9.2D.6.2.

For location-based conditional intra-frequency handover:

- If both condition D1-1 and condition D1-2 are fulfilled earlier than T_{Event_DU} + $T_{identify_intra_with_index}$ or T_{Event_DU} + $T_{identify_intra_without_index}$, then the measurement time delay equal to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ assuming UE only performs measurements within SMTC window of the target cell.

- If both condition D1-1 and condition D1-2 are fulfilled is later than T_{Event_DU} plus $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ for intra-frequency handover, then the measurement time delay equal to the time from the end of T_{event_DU} until time when both condition D1-1 and condition D1-2 are fulfilled.

For inter-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$ defined in TS 38.133 [6] clause 9.3D.4.

For location-based conditional inter-frequency handover,

- If both condition D1-1 and condition D1-2 are fulfilled earlier than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equal to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$, assuming that the UE uses only the SMTC window of the target inter-frequency carrier for performing the measurements.

- If both condition D1-1 and condition D1-2 are fulfilled later than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equal to the time from the end of T_{event_DU} until time of both condition D1-1 and condition D1-2 are fulfilled.

When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency handover. If a cell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency handover becomes undetectable for a period and then the cell becomes detectable again and triggers a handover, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where μ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

[TS 38.133 clause 6.1E.2.2.3]

$T_{CHO_execution}$ is the UE execution preparation time for conditional handover, and starts after UE realizes the condition of CHO is met and identity of the target cell is determined. $T_{CHO_execution}$ can be up to 10ms.

[TS 38.133 clause 6.1E.2.2.4]

The interruption time is the time between when the UE starts to execute the conditional handover to the target cell and the time the UE starts transmission of the new PRACH.

For intra-frequency or inter-frequency conditional conditional handover, the interruption time shall be less than

$$T_{interrupt} = T_{processing} + T_{IU} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3]

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2ms.

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise Trs is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5ms assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms. If the UE has been

provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

NOTE 1: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target cell.

The normative reference for this requirement is TS 38.133 [6] clause 6.1E.2.2.

19.2.2.1 Intra-frequency distance-based conditional Handover from FR1 to FR1

Editor's note: This test case is incomplete:

- Testability issues regarding triggering of location based conditional handover during the test.
- UE position coordinate system (L, B, H) needs to be updated in TS 38.133 [6].

19.2.2.1.1 Test purpose

To verify the requirement for the NR FR1-NR FR1 intra-frequency distance-based conditional handover for ATG requirements specified in 38.133 [6] 6.1E.2.2.

19.2.2.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards and supporting conditional handover.

19.2.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.2.1.

19.2.2.1.4 Test description

19.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

This test shall be tested using any of the test configurations in Table 19.2.2.1.4.1-1.

19.2.2.1.4.2 Test procedure

The test scenario comprises of 2 NR carrier and two cells, Cell 1 and Cell 2, on each carrier respectively. General parameters and Cell-specific parameters for Cell 1 and Cell 2 are given in Table 19.2.2.1.4.1-3 and 19.2.2.1.5-1 respectively. Measurement gap (gap pattern #0) is configured in the test case.

The test consists of two successive time periods, with time durations of T1 and T2 respectively.

Time interval T1 needs to start immediately after the UE position and moving speed are configured via AT commands. The UE is configured to measure intra-frequency neighbour cell. The RRC message implying distance-based handover to Cell 2 with Event D1 shall be sent to UE, at a time earlier than T_{RRC} (10ms) before the beginning of T2. where

- T_{RRC} = 10ms, is the RRC procedure delay defined in clause 12 in TS 38.331 [13].

From start of T2, the Cell 2 becomes detectable and offset better than Cell 1 and location condition event condEventD1-r17 is is satisfied. During T2, the UE performs measurement on Cell 2 and evaluates the execution condition, and starts handover procedure when execution condition is satisifed. The UE shall sent PRACH to Cell 2 less than $T_{measure}$ + $T_{CHO_execution}$ + $T_{interrupt}$ ms from the start of T2. The Interruption length $T_{interrupt}$ shall also be verified in T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell. Set Cell 2 physical cell identity to the initial physical cell identity.

2. Set the parameters according to T1 in Table 19.2.2.1.5-1. Propagation conditions are set according to Annex C clause C.2.2. UE position and moving speed are configured on the UE via AT commands. Immediately after that, T1 starts. The SS starts continuously scheduling the UE to perform DL reception in every DL slot on Cell 1 and monitoring corresponding ACK/NACK feedbacks sent by the UE.

3. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008).

4. The SS shall transmit an *RRCReconfiguration* message with *conditionalReconfiguration* on Cell 1 to configure distanced-based CHO execution condition and measurement gap pattern #0 for the UE.

5. The UE shall transmit an *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.2.1.5-1. T2 starts.

7. If

   a) the UE transmits the PRACH preambles to Cell 2 less than $T_{measure}$ + $T_{CHO_execution}$ + $T_{interrupt}$ ms from the beginning of time period T2,

   and

   b) no longer than X consecutive ACK/NACK DTXs are observed by the SS from the start of T2 to the instant the UE transmits the first PRACH preamble, where

      - $X = T_{interrupt} + k_1$ for test configuration 19.2.2.1-1
      - $X = T_{interrupt}$ for test configuration 19.2.2.1-2
      - $X = 2 \cdot T_{interrupt}$ for test configuration 19.2.2.1-3.

   then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

8. After T2 expires, the SS sends an *RRCReconfiguration* with *reconfigurationWithSync* to cause UE handover back to Cell 1.

9. If UE is not in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1, switch off and on the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
Note 4: 2412Hz is the maximum value of doppler with carrier frequency of 2170MHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.
Note 5: 5556Hz is the maximum value of doppler with carrier frequency of 5GHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.

The UE shall start to transmit the PRACH to Cell 2 less than 872 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay is defined in TS 38.133 [6] clause 6.1E.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay T_{RRC} = 10 ms and is specified in clause 12 in TS 38.331 [2].

T_{Event_DU} = start of T2

At start of T2,

distance to source cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 15 - (-4600))^2}$ = 10057.8m, and D1-1 = 10000m

distance to target cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 15 - (14479))^2}$ = 9942.4m, and D1-2 = 10000m

i.e. D1-1 and D1-2 conditions are fulfilled at start of T2 with >=50m location margin.

$T_{measure}$ = max(600 + 200 ms, 0) = 800 ms;

$T_{interrupt}$ = 62ms; $T_{CHO_execution}$ = 10ms.

This gives a total of 800ms + 62ms + 10ms = 872 ms.

19.2.2.2 Inter-frequency distance-based conditional Handover from FR1 to FR1

Editor's note: This test case is incomplete:

- Testability issues regarding triggering of location based conditional handover during the test.
- UE position coordinate system (L, B, H) needs to be updated in TS 38.133 [6].

19.2.2.2.1 Test purpose

To verify the requirement for the NR FR1-NR FR1 inter-frequency distance-based conditional handover for ATG requirements specified in 38.133 [6] 6.1E.2.2.

19.2.2.2.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards and supporting distance-based conditional handover.

19.2.2.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.2.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.2.2.

19.2.2.2.4 Test description

19.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

This test shall be tested using any of the test configurations in Table 19.2.2.2.4.1-1.

19.2.2.2.4.2 Test procedure

The test scenario comprises of 2 NR carrier and two cells, Cell 1 and Cell 2, on each carrier respectively. General parameters and Cell-specific parameters for Cell 1 and Cell 2 are given in Table 19.2.2.2.4.1-3 and 19.2.2.2.5-1 respectively. Measurement gap (gap pattern #0) is configured in the test case.

The test consists of two successive time periods, with time durations of T1 and T2 respectively.

Time interval T1 needs to start immediately after the UE position and moving speed are configured via AT commands. During T1, the UE is configured to measure inter-frequency neighbour cell and Gap pattern ID gp0. The RRC message implying distance-based handover to Cell 2 with Event D1 shall be sent to UE, at a time earlier than T_{RRC} (10ms) before the beginning of T2. where

- T_{RRC} = 10ms, is the RRC procedure delay defined in clause 12 in TS 38.331 [13].

From start of T2, the Cell 2 becomes detectable and offset better than Cell 1 and after 9976ms of T2, location condition event condEventD1-r17 is satisfied. During T2, the UE performs measurement on Cell 2 and evaluates the execution condition, and starts handover procedure when execution condition is satisifed. The UE shall sent PRACH to Cell 2 less than $T_{measure} + T_{CHO_execution} + T_{interrupt}$ ms from the start of T2. The Interruption length $T_{interrupt}$ shall also be verified in T2.

1. Ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the *RRCReconfiguration* message. Cell 1 is the active cell. Set Cell 2 physical cell identity to the initial physical cell identity.

2. Set the parameters according to T1 in Table 19.2.2.2.5-1. Propagation conditions are set according to Annex C clause C.2.2. UE position and moving speed are configured on the UE via AT commands. Immediately after that, T1 starts. The SS starts continuously scheduling the UE to perform DL reception in every DL slot on Cell 1 and monitoring corresponding ACK/NACK feedbacks sent by the UE.

3. Set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008).

4. The SS shall transmit an *RRCReconfiguration* message with *conditionalReconfiguration* on Cell 1 to configure distanced-based CHO execution condition and measurement gap pattern #0 for the UE.

5. The UE shall transmit an *RRCReconfigurationComplete* message.

6. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.2.2.5-1. T2 starts.

7. If

   c) the UE transmits the PRACH preambles to Cell 2 less than $T_{measure} + T_{CHO_execution} + T_{interrupt}$ ms from the beginning of time period T2,

   and

   d) no longer than X consecutive ACK/NACK DTXs are observed by the SS from the start of T2 to the instant the UE transmits the first PRACH preamble, where

   - $X = T_{interrupt} + k_1$ for test configuration 19.2.2.2-1
   - $X = T_{interrupt}$ for test configuration 19.2.2.2-2
   - $X = 2 \cdot T_{interrupt}$ for test configuration 19.2.2.2-3.

   then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

8. After T2 expires, the SS sends an *RRCReconfiguration* with *reconfigurationWithSync* to cause UE handover back to Cell 1.

9. If UE is not in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1, switch off and on the UE. Then ensure the UE is in State RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 on Cell 1.

10. Repeat steps 2-9 until the confidence level according to Tables G.2.3-1 in Annex G clause G.2 is achieved.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.						
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.						
NOTE 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.						
NOTE 4: 2412 Hz is the maximum value of doppler with carrier frequency of 2170 MHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.						
NOTE 5: 5556 Hz is the maximum value of doppler with carrier frequency of 5 GHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.						

The UE shall start to transmit the PRACH to Cell 2 later than 9976 ms and less than 10048 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay is defined in clause 6.1E.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay T_{RRC} = 10 ms and is specified in clause 12 in TS 38.331 [2].

T_{Event_DU} = start of T2

At 9976 ms after start of T2,

distance to source cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 14.976 - (-4600))^2}$ = 10050.2m, and D1-1 = 10000m

distance to target cell reference location is $\sqrt{(3000)^2 + (1200 * 1000/3600 * 14.976 - (14479))^2}$ = 9949.08m, and D1-2 = 10000m

i.e. D1-1 and D1-2 conditions are fulfilled at start of T2 with >=50m location margin.

$T_{measure}$ = max(600 + 200 ms, 9976 ms) = 9976 ms;

$T_{interrupt}$ = 62 ms; $T_{CHO_execution}$ = 10 ms.

This gives a total of 9976 ms + 62 ms + 10 ms = 10048 ms.

19.2.3.1 SA: RRC re-establishment for ATG

19.2.3.1.0 Minimum conformance requirements

19.2.3.1.0.1 Minimum conformance requirements for NR FR1 re-establishment

In RRC_CONNECTED state the UE shall be capable of sending *RRCReestablishmentRequest* message within $T_{re\text{-}establish_delay}$ seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ($T_{re\text{-}establish_delay}$) shall be less than:

$$T_{re-establish_delay} = T_{UE_re-establish_delay} + T_{UL_grant}$$

T_{UL_grant}: It is the time required to acquire and process uplink grant from the target PCell. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) is the time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) requirement shall be less than:

$$T_{UE_re-establish_delay} = 50\ \text{ms} + T_{identify_intra_NR} + \sum_{i=1}^{N_{freq}-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

The intra-frequency target NR cell shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clause 10.1.2 is fulfilled for a corresponding NR Band for FR1, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.X1 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.4 are fulfilled for a corresponding NR Band for FR1, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.X2 for a corresponding NR Band are fulfilled.

$T_{identify_intra_NR}$: It is the time to identify the target intra-frequency NR cell and it depends on whether the target NR cell is known cell or unknown cell. If the UE is not configured with intra-frequency NR carrier for RRC re-establishment then $T_{identify_intra_NR}$=0; otherwise $T_{identify_intra_NR}$ shall not exceed the values defined in Table 19.2.3.1.0.1-1.

$T_{identify_inter_NR,i}$: It is the time to identify the target inter-frequency NR cell on inter-frequency carrier *i* configured for RRC re-establishment and it depends on whether the target NR cell is known cell or unknown cell. $T_{identify_inter_NR,i}$ shall not exceed the values defined in Table 19.2.3.1.0.1-2.

T_{SMTC}: It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2*, T_{smtc} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{SMTC,i}$: It is the periodicity of the SMTC occasion configured for the inter-frequency carrier *i*. If it is not configured, the UE may assume that the target SSB periodicity is no larger than 20 ms.

T_{SI-NR}: It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell.

T_{PRACH}: It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{PRACH} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

N_{freq}: It is the total number of NR frequencies to be monitored for RRC re-establishment; N_{freq} = 1 if the target intra-frequency NR cell is known, else N_{freq} = 2 and $T_{identify_intra_NR}$ = 0 if the target inter-frequency NR cell is known.

There is no requirement if the target cell does not contain the UE context.

In the requirement defined in the below tables, the target FR1 cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown.

19.2.3.1.1 Intra-frequency RRC Re-establishment in FR1 for ATG

Editor's note: This test case is incomplete for the following configurations:

- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.2.3.1.1.1 Test purpose

To verify the NR ATG UE's ability to perform NR intra-frequency RRC re-establishment delay in FR1 with known target cell is within the specified limit for ATG.

19.2.3.1.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 and forward.

19.2.3.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

This test shall be tested using any of the test configurations in Table 19.2.3.1.1.4.1-1.

19.2.3.1.1.4.2 Test procedure

The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message.
2. Set the parameters according to T1 in Table 19.2.3.1.1.5-1. T1 starts.
3. SS shall transmit an RRCReconfiguration message.
4. The UE shall transmit RRCReconfigurationComplete message.
5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.3.1.1.5-1. T2 starts
6. When T2 expires, the SS shall switch the power setting from T2 to T3 as specified in Table 19.2.3.1.1.5-1. T3 starts
7. If the UE starts to send PRACH preambles to cell 2 for sending the *RRCReestablishmentRequest* message to cell 2 within 1840 ms (= 220ms + 1.6 s) from the beginning of time period T2, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
8. After T3 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.
9. Repeat step 2-8 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The RRC re-establishment delay is defined as the time from the moment UE declares RLF, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to a known NR intra frequency cell shall be less than 1.6 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

T_{UL_grant} = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence T_{UL_grant} is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 1$

$T_{identify_intra_NR}$ = 200 ms

T_{SI} = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target intra-frequency NR cell.

T_{PRACH} = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 1545 ms for RRC re-establishment delay, allow 1840 ms (240 ms + 1.6 s) from the beginning of T2 in the test case.

19.2.3.1.2.4.2 Test procedure

The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, becomes inactive. The time period T3 starts after the occurrence of the radio link failure. During T1, the UE shall be configured with the carrier frequency of cell 2 (with RF Channel Number #2) to ensure that the UE has the context of the carrier frequency of cell 2 by the end of T1.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Establish SRB2 and DRB in the RRC Reconfiguration message.
2. Set the parameters according to T1 in Table 19.2.3.1.2.5-1. T1 starts.
3. SS shall transmit an RRCReconfiguration message.
4. The UE shall transmit RRCReconfigurationComplete message.
5. When T1 expires, the SS shall switch the power setting from T1 to T2 as specified in Table 19.2.3.1.2.5-1. T2 starts

6. When T2 expires, the SS shall switch the power setting from T2 to T3 as specified in Table 19.2.3.1.2.5-1. T3 starts

7. If the UE starts to send PRACH preambles to cell 2 for sending the *RRCReestablishmentRequest* message to cell 2 within 3 s from the beginning of time period T3, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.

8. After T3 expires, cause UE handover back to Cell 1 (if the handover fails, switch off the UE) or switch off the UE. Then ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.

9. Set cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.

10. Repeat step 2-9 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

		3	AWGN [500Hz]					

Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to an unknown NR inter frequency cell without serving cell timing shall be less than 3s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

T_{UL_grant} = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence T_{UL_grant} is not used.

$$T_{UE_re-establish_delay} = 50\,ms + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

N_{freq} = 2

$T_{identify_intra_NR}$ = 800 ms

$T_{identify_inter_NR}$ = 800 ms

T_{SI} = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target inter-frequency NR cell.

T_{PRACH} = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 2945 ms, allow 3 s in the test case.

19.2.3.2 Random Access for ATG

19.2.3.2.0 Minimum conformance requirements

19.2.3.2.0.1 Minimum conformance requirements for Contention based random access

The 4-step and 2-step random access requirements described in clause 6.3.2.2.0.1 are applicable for ATG UEs.

The normative reference for this requirement is TS 38.133 [6] clauses 6.2D.2.

19.2.3.2.0.2 Minimum conformance requirements for Non-Contention based random access

The 4-step and 2-step non-contention based random access requirements described in clause 6.3.2.2.0.2 are applicable for ATG UEs.

The normative reference for this requirement is TS 38.133 [6] clauses 6.2D.2.

19.2.3.2.1 NR SA FR1 4-step RA type contention based random access test for ATG

Editor's note: This test case is incomplete in following aspects:

- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.2.3.2.1.1 Test purpose

The purpose of this test is to verify that the behaviour of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in TS 38.133 [6] clause 6.2D.2.2 and clause 7.1D.2 in an AWGN with constant residual doppler model.

19.2.3.2.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 onwards.

19.2.3.2.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 19.2.3.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.2.3.2.1.

19.2.3.3 SA: RRC Connection Release with Redirection for ATG

19.2.3.3.0 Minimum conformance requirements

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR}$.

The time delay ($T_{connection_release_redirect_NR}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [13]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR}$) shall be less than:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH}$$

The target NR cell shall be considered detectable when for each relevant SSB, the following side conditions are met:

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.5 for a corresponding NR Band are fulfilled.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [13].

$T_{identify\text{-}NR}$: It is the time to identify the target NR cell and depends on the FR of the target NR cell. It is defined in Table 19.2.3.3.0-1. Note that $T_{identify\text{-}NR} = T_{PSS/SSS\text{-}sync} + T_{meas}$, in which $T_{PSS/SSS\text{-}sync}$ is the cell search time and T_{meas} is the measurement time due to cell selection criteria evaluation. $T_{SI\text{-}NR}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

T_{RACH}: It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{RACH} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in Table 8.1-1 of TS 38.213 [8].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise T_{rs} is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the *measObjectNR*s with the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, T_{rs} is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with T_{rs} = 20 ms if the SSB transmission periodicity is not larger than 20 ms; otherwise,

- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

Table 19.2.3.3.0-1: Time to identify target NR cell for RRC connection release with redirection to NR

FR of target NR cell	$T_{identify\text{-}NR}$
FR1	MAX (680 ms, 11 x $N1^{Note2}$ x T_{rs})
NOTE 1: If the UE has been provided with higher layer signalling of *smtc2* specified in TS 38.331 [13] prior to the redirection command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell. NOTE 2: For ATG UEs capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.

19.2.3.3.1.4.2 Test procedure

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. The "*RRCRelease*" message shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2. Cell 1 and Cell 2 belong to different tracking areas.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell.
2. Set the parameters according to T1 in Table19.2.3.3.1.5-1. T1 starts.
3. SS shall transmit an *RRCRelease* during period T1.
4. The SS shall switch the power setting from T1 to T2 as specified in Table19.2.3.3.1.5-1. When the last TTI containing the *RRCRelease* message is sent to UE, T2 starts.
5. If the UE transmits the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2 then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
6. After T2 expires, the UE shall be switched off. Then ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On and Test Mode *On* according to TS 38.508-1 [14] clause 4.5. Cell 1 is the active cell and Cell 2 shall be powered OFF.
7. The SS shall set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 1008) for next iteration of the test procedure loop.
8. Repeat step 2-7 until the confidence level according to Table G.2.3-1 in Annex G clause G.2 is achieved.

19.2.3.3.1.4.3 Message contents

Message contents are according to TS 38.508-1 [14] clause 7.3 with the following exceptions:

Note 2:	Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
Note 3:	Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

For UEs that don't support *antennaArrayType-r1*8 and UEs that support *antennaArrayType-r18*:

The UE shall start to transmit the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to NR observed during repeated tests shall be at least 90%.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH},$$

where:

$T_{RRC_procedure_delay}$ = 110 ms in the test.

$T_{identify\text{-}NR}$ = 680 ms in the test.

$T_{SI\text{-}NR}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 38.331 [13] for the target NR cell.

T_{RACH} = 170 ms in the test.

19.3 Timing for ATG

19.3.1 UE transmit timing

19.3.1.0 Minimum conformance requirements

19.3.1.0.1 Minimum conformance requirements for UE transmit timing accuracy

The ATG UE initial transmission timing error shall be less than or equal to $\pm T_{e_ATG}$ where the timing error limit value T_{e_ATG} is specified in table 19.3.1.0.1-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission.

The ATG UE shall meet the T_{e_ATG} requirement for an initial transmission provided that at least one SSB is available at the ATG UE during the last 160 ms. The reference point for the ATG UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}}$.

The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the ATG UE to determine downlink timing is received from the reference cell at the ATG UE antenna.

N_{TA} for PRACH is defined as 0. $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}}$ (in T_{c} units) for other channels is the difference between ATG UE transmission timing and the downlink timing immediately after when the last timing advance in clause 7.3D was applied, or after the last update in $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$.

The value of $N_{\mathrm{TA\,offset}}$ depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR). $N_{\mathrm{TA\,offset}}$ is defined in Table 19.3.1.0.1-2.

$N_{\mathrm{TA,adj}}^{\mathrm{UE}}$ is defined in TS 38.211 [7].

Table 19.3.1.0.1-1: T_{e_ATG} Timing Error Limit

Frequency Range	SCS of SSB signals (kHz)	SCS of uplink signals (kHz)	T_{e_ATG}

		30	18*64*Tc
		60	N/A
	30	15	16*64*Tc
		30	16*64*Tc
		60	N/A
NOTE 1: T_c is the basic timing unit defined in TS 38.211 [7]			

Table 19.3.1.0.1-2: The Value of $N_{\text{TA offset}}$

Frequency range and band of cell used for uplink transmission	$N_{\text{TA offset}}$ (Unit: Tc)
FR1 FDD or TDD band with neither E-UTRA–NR nor NB-IoT–NR coexistence case	25600 (Note 1)
FR1 FDD band with E-UTRA–NR and/or NB-IoT–NR coexistence case	0 (Note 1)
FR1 TDD band with E-UTRA–NR and/or NB-IoT–NR coexistence case	39936 (Note 1)
FR2	13792
Note 1: The UE identifies $N_{\text{TA offset}}$ based on the information n-TimingAdvanceOffset as specified in TS 38.331 [13]. If UE is not provided with the information n-TimingAdvanceOffset, the default value of $N_{\text{TA offset}}$ is set as 25600 for FR1 band. In case of multiple UL carriers in the same TAG, UE expects that the same value of n-TimingAdvanceOffset is provided for all the UL carriers according to clause 4.2 in TS 38.213 [8] and the value 39936 of $N_{\text{TA offset}}$ can also be provided for an FDD serving cell. Note 2: Void	

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH and SRS transmission, the ATG UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell, the updating of $N_{\text{TA,adj}}^{\text{UE}}$, except when the timing advance in clause 7.3D is applied.

When the transmission timing error between the ATG UE and the reference timing exceeds $\pm T_{e_ATG}$ then the ATG UE is required to adjust its timing to within $\pm T_{e_ATG}$. The reference timing shall be $\left(N_{\text{TA}} + N_{\text{TA offset}} + N_{\text{TA,adj}}^{\text{UE}}\right) \times T_c$ before the downlink timing of the reference cell. All adjustments made to the ATG UE uplink timing shall follow these rules:

1) The maximum amount of the magnitude of the timing change, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ due to ATG UE position update, in one adjustment shall be T_{q_ATG}.

2) The minimum aggregate adjustment rate, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ due to ATG UE position update, shall be T_{p_ATG} per second.

3) The maximum aggregate adjustment rate, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ due to ATG UE position update, shall be T_{q_ATG} per 200 ms.

Where, the maximum autonomous time adjustment step T_{q_ATG} and the aggregate adjustment rate T_{p_ATG} are specified in table 19.3.1.0.1-3.

Table 19.3.1.0.1-3: T_{q_ATG} Maximum Autonomous Time Adjustment Step and T_{p_ATG} Minimum Aggregate Adjustment rate

19.3.1.1 NR SA FR1 UE Transmit Timing Test for ATG

Editor's note: This test case is incomplete in following aspects:

- TT analysis is missing.
- T_GNSS_margin need to be subtracted for the final test requirement.
- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.3.1.1.1 Test purpose

The purpose of this test is to verify that the UE can follow frame timing change of the connected gNodeb and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in TS 38.133 [6] clause 7.1D.2.

19.3.1.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 onwards.

19.3.1.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 19.3.1.0.1.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.			
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.			
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.			
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.			
NOTE 5: SRS configs are given in Table 6.4.1.1.5-2.			
NOTE 6: 2412 Hz is the maximum value of doppler with carrier frequency of 2170 MHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.			
NOTE 7: 5556 Hz is the maximum value of doppler with carrier frequency of 5 GHz. The specific doppler shift trajectory is up to test system's design considering of BS location and UE GNSS emulation.

19.3.2 UE timer accuracy for ATG

19.3.3 Timing advance for ATG

19.3.3.0 Minimum conformance requirements

ATG UE shall adjust the timing of its uplink transmission timing from the beginning of uplink at time slot $n+ k+1+2^{\mu} \cdot K_{\text{offset}}$ for a timing advance command received in time slot n, and the value of k, μ and K_{offset} are defined in clause 4.2 in TS 38.213 [8]. The same requirement applies also when the ATG UE is not able to transmit a configured uplink transmission due to the channel assessment procedure.

The ATG UE shall adjust the timing of its transmissions, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ between the preceding uplink transmission and the current transmission, with a relative accuracy better than or equal to the ATG UE Timing Advance adjustment accuracy requirement in Table 19.3.3.0-1, to the signalled timing advance value compared to the timing of preceding uplink transmission. The timing advance command step is defined in TS 38.213 [8].

The normative reference for this requirement is TS.38.133 [6] clause 7.3D.2.

19.3.3.1 NR SA FR1 timing advance adjustment accuracy for ATG

Editor's note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.3.3.1.1 Test purpose

The purpose of the test is to verify UE Timing Advance adjustment delay and accuracy requirement defined in TS 38.133 [6] clause 7.3D.

19.3.3.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 onwards.

19.3.3.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 19.3.3.0.

The normative reference for this requirement is TS 38.133 [6] clause A.19.3.3.1.

19.4 Signalling characteristics for ATG

19.4.1 Radio link monitoring for ATG

19.4.1.0 Minimum conformance requirements

19.4.1.0.1 Minimum conformance requirements for SSB based RLM

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold Q_{out_SSB} within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold Q_{in_SSB} within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 19.4.1.0.1-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array,

- P value for an RLM-RS resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max(T_{L1}, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:
    - N_{total} is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
    - T_{L1} is periodicity of the target RLM-RS
    - $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Table 19.4.1.0.1-1: Evaluation period $T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ for FR1

Configuration	$T_{Evaluate_out_SSB}$ (ms)	$T_{Evaluate_in_SSB}$ (ms)
no DRX	Max(200, Ceil(10 × P) × T_{SSB})	Max(100, Ceil(5 × P) × T_{SSB})
DRX cycle≤320 ms	Max(200, Ceil(15 × P) × Max(T_{DRX},T_{SSB}))	Max(100, Ceil(7.5 × P) × Max(T_{DRX},T_{SSB}))
DRX cycle>320 ms	Ceil(10 × P) × T_{DRX}	Ceil(5 × P) × T_{DRX}
NOTE: T_{SSB} is the periodicity of the SSB configured for RLM. T_{DRX} is the DRX cycle length.		

19.4.1.0.2 Minimum conformance requirements for CSI-RS based RLM

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS}$ within $T_{Evaluate_out_CSI\text{-}RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_CSI\text{-}RS}$ within $T_{Evaluate_in_CSI\text{-}RS}$ evaluation period.

- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 19.4.1.0.2-1 for FR1.

The requirements of $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and
- P = 1, when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array,

- P value for an RLM-RS resource to be measured is defined as

  $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$

  $N_{total} / N_{available}$ with $N_{available} > 0$

  - For a window W of duration max(T_{L1}, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:
  - N_{total} is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is
    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
  - T_{L1} is periodicity of the target RLM-RS
  - $P_{sharing\ factor}$ = 3.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of M_{out} and M_{in} used in table 19.4.1.0.2-1 are defined as:

- M_{out} = 20 and M_{in} = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6 clause 7.4.1] set to 3 and over the bandwidth ≥ 24 PRBs.

Table 19.4.1.0.2-1: Evaluation period $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ for FR1

Configuration	$T_{Evaluate_out_CSI-RS}$ (ms)	$T_{Evaluate_in_CSI-RS}$ (ms)
no DRX	Max(200, Ceil(M_{out}×P)×T_{CSI-RS})	Max(100, Ceil(M_{in}×P) × T_{CSI-RS})
DRX ≤ 320 ms	Max(200, Ceil(1.5×M_{out}×P)× Max(T_{DRX}, T_{CSI-RS}))	Max(100, Ceil(1.5×M_{in}×P)× Max(T_{DRX}, T_{CSI-RS}))
DRX > 320 ms	Ceil(M_{out}×P) × T_{DRX}	Ceil(M_{in}×P) × T_{DRX}
NOTE: T_{CSI-RS} is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for T_{CSI-RS} equal to 5 ms, 10 ms, 20 ms or 40 ms. T_{DRX} is the DRX cycle length.		

19.4.1.1 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with SSB-based RLM RS in non-DRX mode

Editor's note: This test case is incomplete in following aspects:

- AT Command to set the UE speed and position is not specified in the test procedure
- The specific gNB reference location is missing in test procedure.
- Antenna array is FFS.

19.4.1.1.1 Test purpose

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell. This test will partly verify the FR1 radio link monitoring requirements in TS 38.133 [6] clause 8.1D.

19.4.1.1.2 Test applicability

This test applies to all types of NR ATG UE from release 18.

19.4.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.1.

19.4.1.1.4 Test description

The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure 19.4.1.1.4-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. The UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40 ms) in test 1.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

NOTE 2: The signal contains PDCCH for UEs other than the device under test as part of OCNG. NOTE 3: SNR levels correspond to the signal to noise ratio over the SSS REs. NOTE 4: The SNR in time periods T1, T2 and T3 is denoted as SNR1, SNR2 and SNR3 respectively in Figure A.19.4.1.1.1-1. NOTE 5: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 is A.3.6.					

The UE behaviour in each test during time durations T1, T2 and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The UE shall stop transmitting uplink signal no later than time point C (D1 second after the start of the time duration T3).

The rate of correct events observed during repeated tests shall be at least 90 % with the confidence level of 95%.

19.4.1.2 Radio Link Monitoring In-sync Test for FR1 PCell configured with SSB-based RLM RS in non-DRX mode

Editor's note: This test case is incomplete in following aspects:

- AT Command to set the UE speed and position is not specified in the test procedure.
- The specific gNB reference location is missing in test procedure.
- Antenna array is FFS.

19.4.1.2.1 Test purpose

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell. This test will partly verify the FR1 radio link monitoring requirements in ts 38.133 [6] clause 8.1D.

19.4.1.2.2 Test applicability

This test applies to all types of NR UE from release 18 onwards.

19.4.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.2.

19.4.1.2.4 Test description

The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.19.4.1.2.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms.

NOTE 1: OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: The signal contains PDCCH for UEs other than the device under test as part of OCNG.
NOTE 3: SNR levels correspond to the signal to noise ratio over the SSS REs.
NOTE 4: The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2, SNR3, SNR4 and SNR5 respectively in Figure A.19.4.1.2.1-1.
NOTE 5: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 and T4 is modified as specified in clause A.3.6.

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The rate of correct events observed during repeated tests shall be at least 90 % with the confidence level of 95%.

19.4.1.3 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with CSI-RS-based RLM in non-DRX mode

Editor's Note: This test case is incomplete in following aspects:

- AT Command to set the UE speed and position is not specified in the test procedure.
- The specific gNB reference location is missing in test procedure.
- Antenna array is FFS.

19.4.1.3.1 Test purpose

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when no DRX is used. This test will partly verify the FR1 PCell CSI-RS Out-of-sync radio link monitoring requirements in TS 38.133 [6] clause 8.1D.

19.4.1.3.2 Test applicability

This test applies to all types of NR UE from release 18 onwards.

19.4.1.3.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.1.3.

19.4.1.3.4 Test description

The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure 19.4.1.3.4-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40 ms) in test. In the test, SSB0 is configured as the BFD-RS.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

NOTE 1: OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T1.
NOTE 3: NZP CSI-RS resource set configuration for CSI reporting are assigned to the UE prior to the start of time period T1.
NOTE 4: Measurement gap configuration is assigned to the UE prior to the start of time period T1.
NOTE 5: The timers and layer 3 filtering related parameters are configured prior to the start of time period T1.
NOTE 6: The signal contains PDCCH for UEs other than the device under test as part of OCNG.
NOTE 7: SNR levels correspond to the signal to noise ratio over the SSS REs.
NOTE 8: The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2, SNR3, SNR4 and SNR5 respectively in figure A.19.4.1.4.1-1.
NOTE 9: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 is specified in clause A.3.6.1.1.

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (T6 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting on the PCell.

The rate of correct events observed during repeated tests shall be at least 90 % with the confidence level of 95%.

19.4.2 Beam Failure Detection and Link recovery procedures for ATG

19.4.2.0 Minimum conformance requirements

19.4.2.0.1 Minimum conformance requirements for SSB based beam failure detection

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB}$ period.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 19.4.2.0.1-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array,

- P value for an BFD-RS resource to be measured is defined as:
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max(T_{L1}, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps starting at the beginning of any BFD-RS resource occasion:
    - N_{total} is the total number of BFD-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
    - T_{L1} is periodicity of the target BFD-RS
    - $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Table 19.4.2.0.1-1: Evaluation period $T_{Evaluate_BFD_SSB}$ for FR1

Configuration	$T_{Evaluate_BFD_SSB}$ (ms)
no DRX	$Max(50, Ceil(5 \times P) \times T_{SSB})$
DRX cycle ≤ 320 ms	$Max(50, Ceil(7.5 \times P) \times Max(T_{DRX}, T_{SSB}))$
DRX cycle > 320 ms	$Ceil(5 \times P) \times T_{DRX}$
NOTE: T_{SSB} is the periodicity of SSB in the set $\bar{q}_0$. T_{DRX} is the DRX cycle length.	

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

When the radio link quality on all the RS resources in set $\bar{q}_0$ is worse than Q_{out_LR}, layer 1 of the UE shall send a beam failure instance indication to the higher layers

The beam failure instance evaluation for the RS resources in set $\bar{q}_0$ shall be performed as specified in clause 6 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval_BFD}$.

When DRX is not used, $T_{Indication_interval_BFD}$ is max(2ms, $T_{SSB\text{-}RS,M}$)) or max(2ms, $T_{CSI\text{-}RS,M}$), where $T_{SSB\text{-}RS,M}$ and $T_{CSI\text{-}RS,M}$ is the shortest periodicity of all RS resources in set $\bar{q}_0$ for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set $\bar{q}_0$ or CSI-RS resource in the set $\bar{q}_0$.

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_SSB}$ period becomes better than the threshold Q_{in_LR} provided SSB_RP and SSB Ês/Iot are according to annex B.2.4.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 19.4.2.0.1-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 19.4.2.0.1-2 for FR1.

where:

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,

- If inter-band carrier aggregation within FR1 is configured, and UE not capable of antennaArrayType-r18 on the other serving carrier, or UE support two simultaneous separate Rx beams
- the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,
- otherwise,
  - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- T_{L1} is periodicity of the target CBD-RS
- $P_{sharing\ factor}$ = 3.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of P_{CBD} used in table 19.4.2.0.1-2 is defined as

For each SSB resource in the set $\tilde{q}_1$ configured for a SCell

- P_{CBD} = Z
  - Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell

The normative reference for this requirement is TS.38.133 [6] clause 8.5D.2, 8.5D.4, and 8.5D.5.2.

19.4.2.0.2 Minimum conformance requirements for CSI-RS based beam failure detection

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\tilde{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI-RS}$ period becomes worse than the threshold $Q_{out_LR_CSI-RS}$ within $T_{Evaluate_BFD_CSI-RS}$ period.

The value of $T_{Evaluate_BFD_CSI-RS}$ is defined in table 19.4.2.0.2-1 for FR1.

The requirements of $T_{Evaluate_BFD_CSI-RS}$ apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array,

- P value for an BFD-RS resource to be measured is defined as:

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of M_{BFD} used in table 19.4.2.0.2-1 are defined as:

- M_{BFD} = 10, if the CSI-RS resource(s) in set $\tilde{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of P_{BFD} used in table 19.4.2.0.2-1 is defined as

For each CSI-RS resource in the set $\bar{q}_0$ configured for a SCell

- P_{BFD} = Z
  - Where Z is the number of band(s) on which UE is performing beam failure detection only for SCell

19.4.2.1 NR SA FR1 Beam Failure Detection and Link Recovery Test for PCell configured with SSB-based BFD and LR in non-DRX mode for ATG

Editor's note: This test case is incomplete in following aspects:

- TT analysis is missing.

- AT commands for UE positioning and UE speed setting are FFS.
- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.
- Antenna array is FFS

19.4.2.1.1 Test purpose

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set q_0 configured for a serving cell and that the UE performs correct SSB-based link recovery based on beam candidate set q_1. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR1 serving cell requirements in TS 38.133 [6] clause 8.5D.

19.4.2.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 onwards, supporting SSB based BFD and link recovery.

19.4.2.1.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 19.4.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.2.1.

19.4.2.1.4 Test description

Same as the test description given in clause 6.5.5.1.4.

19.4.2.1.4.1 Initial conditions

Same as the initial conditions given in clause 6.5.5.1.4.1 with following exceptions:

- Table 6.5.5.1.4.1-1 is replaced by Table 19.4.2.1.4.1-1.
- Table 6.5.5.1.4.1-2 is replaced by Table 19.4.2.1.4.1-2.
- Table 6.5.5.1.4.1-3 is replaced by Table 19.4.2.1.4.1-3.
- During the test, changed UE location with the mobility assumption of 0 km/h, the specific UE location should be emulated by test system and provided to UE by AT command or GNSS simulator.
- During the test, the specific gNB reference location is emulated by test system.

NOTE 2: The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T1.
NOTE 3: NZP CSI-RS resource set configuration for CSI reporting are assigned to the UE prior to the start of time period T1.
NOTE 4: Measurement gap configuration is assigned to the UE prior to the start of time period T1.
NOTE 5: The timers and layer 3 filtering related parameters are configured prior to the start of time period T1.
NOTE 6: The signal contains PDCCH for UEs other than the device under test as part of OCNG.
NOTE 7: SNR levels correspond to the signal to noise ratio over the SSS REs.
NOTE 8: The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2 and SNR3 respectively in figure A.4.5.5.1.1-1.
NOTE 9: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 is modified as specified in clause A.3.6.

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set q_1.

No later than time point F occurring no later than D1 = 130 ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set q_1. The UE shall not transmit preamble on a beam associated with the candidate beam set q_1 earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90 %.

19.4.2.2 NR SA FR1 Beam Failure Detection and Link Recovery Test for PCell configured with CSI-RS-based BFD and LR in non-DRX mode for ATG

Editor's note: This test case is incomplete in following aspects:

- TT analysis is missing.

- AT commands for UE positioning and UE speed setting are FFS.

- UE specific positioning and the specific gNB reference location emulated by test system are FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.
- Antenna array is FFS.

19.4.2.2.1 Test purpose

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set q_0 configured for a serving cell and that the UE performs correct CSI-RS-based link recovery based on beam candicate set q_1. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery for an FR1 serving cell requirements in TS 38.133 [6] clause 8.5D.

19.4.2.2.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 onwards supporting CSI-RS based BFD and link recovery.

19.4.2.2.3 Minimum conformance requirement

The minimum conformance requirements are specified in clause 19.4.2.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.2.2.

19.4.3 Active BWP switch for ATG

19.4.3.1 DCI-based and timer-based active BWP switch for ATG

19.4.3.1.0 Minimum conformance requirements

19.4.3.1.0.1 Minimum conformance requirements for DCI-based and timer-based active BWP switch

The requirements in this clause apply for an ATG UE. The requirements in this clause only apply to the case that the BWP switch is performed on the PCell with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y=0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (FR1) immediately after a BWP-inactivity timer *bwp-InactivityTimer* [13] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* [13] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in table 19.4.3.1.0.1-1.

Table 19.4.3.1.0.1-1: BWP switch delay

μ	NR Slot length (ms)	BWP switch delay $T_{BWPswitchDelay}$ (slots)	
		Type 1[Note 1]	Type 2[Note 1]
0	1	1	3
1	0.5	2	5
2	0.25	3	9
NOTE 1: Depends on UE capability. NOTE 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch.			

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in TS 38.133 [6] clause 8.10D or 8.15D in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in TS 38.133 [6] clause 8.10D or 8.15D in the new BWP

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.The normative reference for this requirement is TS 38.133 [6] clauses 8.6D.2.

19.4.3.1.1 NR SA FR1 DCI-based DL active BWP switch in non-DRX for ATG

Editor's note: This test is incomplete in the following aspects:

- Speed setting is FFS.
- Antenna array is FFS.

19.4.3.1.1.1 Test purpose

The purpose of this test is to verify the DL BWP switch delay requirement defined in clause 19.4.3.1.0.1.

19.4.3.1.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards supporting BWP adaptation of at least 2 BWPs, DCI and timer-based active BWP switching delay Type1 or Type2.

19.4.3.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.3.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.3.1.1.

1. The general test parameter settings are set up according to Table 19.4.3.1.1.4.1-3.
2. Message contents are defined in clause 19.4.3.1.1.4.3.
3. The test scenario comprises of one NR PCell (Cell 1). Cell 1 is configured according to Annex C.1.2 and C.1.3.
4. By step 4 of the test procedure:
   - UE is connected to Cell 1 on radio channel 1.
   - UE is configured with 2 different UE-specific downlink bandwidth parts, BWP-1 and BWP-2 before starting the test. BWP-1 and BWP-2 always include bandwidth of the initial DL BWP and SSB.
   - UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1.
   - UE is configured with a *bwp-InactivityTimer* timer value for Cell 1.
5. The initial test environment conditions are setup according to clause 19.0.1.

19.4.3.1.1.4.2 Test procedure

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 1 and the time duration of T2.

The Cell 1 has constant signal levels throughout the test.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Tables 19.4.3.1.1.4.1-3 and 19.4.3.1.1.5-1. Propagation conditions are set according to Annex C clauses C.2.2.
3. The SS shall transmit an *RRCReconfiguration* message releasing the dedicated configuration of the *initialDownlinkBWP* and the *initialUplinkBWP*. This message also configures 2 different UE-specific bandwidth parts, BWP-1 and BWP-2, which always include the bandwidth of the initial DL BWP and SSB. The SS indicates BWP-1 as the active DL BWP using *firstActiveDownlinkBWP-Id*, according to Table 19.4.3.1.1.4.3-2. UE is configured with a bwp-InactivityTimer timer value for PCell.
4. The SS shall send a DCI format 1_1 command for Cell 1 DL BWP switch.
5. The UE shall receive the DCI format 1_1 command in slot # denoted i, then T1 starts and the UE switch its bandwidth part from BWP-1 to BWP-2:

If the UE starts to report valid ACK/NACK for Cell 1 from the first UL slot that occurs after the beginning of DL slot ($i+T_{BWPswitchDelay}+k1$), the number of successful subtests is increased by one. Otherwise, count a fail for the test, switch off/on the UE and go to step 1.

6. If the UE sends valid ACK/NACK for the Cell 1 on BWP-2, T2 starts. During T2, the SS shall not transmit DCI format for PDSCH reception on Cell 1.

7. T3 starts from the first slot #j of the DL subframe immediately after the slot wherein *bwp-InactivityTimer* timer expires and the SS restarts to send DCI format for PDSCH reception on PCell. Then, the UE shall switch its bandwidth part from BWP-2 back to the default bandwidth part, BWP-1:

   If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot ($j+T_{BWPswitchDelay}+k1$), the number of successful subtests is increased by one and go to step 8 after T3 expires. Otherwise, count a fail for the test, switch off/on the UE and go to step 1.

8. Repeat steps 4-7 until the confidence level according to Annex G clause G.2.3 is achieved.

The SS verifies the DL BWP switch time by counting the slots from the time when the BWP switch command is received or *bwp-InactivityTimer* timer expires till an ACK/NACK is received.

If all subtests pass, the test passes. If one subtest fails, the test fails.

NOTE 1: OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.		
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.		
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.		
NOTE 4: For unpaired spectrum, a DL BWP is linked with an UL BWP. DLBWP.0.2 is linked with ULBWP.0.2; DLBWP.1.1 is linked with ULBWP.1.1; DLBWP.1.3 is linked with ULBWP.1.3 defined in clause 12 of TS 38.213 [8].		

During T1, the UE shall start to send the ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot ($i+T_{BWPswitchDelay}+k1$).

During T3, the UE shall start to send the ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot ($j+T_{BWPswitchDelay}+k1$).

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in [12].

Depending on UE capability *bwp-SwitchingDelay* [13], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in table 19.4.3.1.0.1-1.

All of the above test requirements shall be fulfilled in order for the observed Cell 1 active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90 %.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK/NACK in the first UL slot that occurs after beginning of DL slot ($i+T_{BWPswitchDelay}+k1$), ($j+T_{BWPswitchDelay}+k1$), then the UE shall use the next available uplink resource for reporting the corresponding ACK/NACK.

19.4.3.2 RRC-based Active BWP Switch for ATG

19.4.3.2.0 Minimum conformance requirements

19.4.3.2.0.1 Minimum conformance requirements for RRC-based Active BWP switch for ATG

The requirements in this clause only apply to the case that the BWP switch is performed on the PCell with one or more than one BWP configuration(s) configured, with

- Active BWP switch or parameter change of its active BWPs for PCell

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessing\,Delay}+T_{BWPswitchDelayRRC}}{NR\,Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessing\,Delay}$ is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [13], and

$T_{BWPswitchDelayRRC} = 6ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on PCell. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where T_{HARQ} is the time between DL data transmission and acknowledgement as specified in TS 38.213 [8].

The normative reference for this requirement is TS 38.133 [6] clause 8.6D.3.

19.4.3.2.1 NR SA FR1 RRC-based DL active BWP switch in non-DRX for ATG

Editor's note: This test is incomplete in the following aspects:

- Speed setting is FFS.
- Antenna array is FFS.

19.4.3.2.1.1 Test purpose

The purpose of this test is to verify the DL BWP switch delay requirement for RRC-based BWP switch defined in clause 19.4.3.2.0.1.

19.4.3.2.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards supporting BWP adaptation of at least 2 BWPs.

19.4.3.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.3.2.0.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.3.2.1.

19.4.3.2.1.4 Test description

19.4.3.2.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.4.3.2.1.4.1-1.

Table 19.4.3.2.1.4.1-1: Supported test configurations for NR SA FR1 RRC-based DL active BWP switch in non-DRX for ATG

1. The general test parameter settings are set up according to Table 19.4.3.2.1.4.1-3.
2. Message contents are defined in clause 19.4.3.2.1.4.3.
3. The test scenario comprises of one NR PCell (Cell 1). Cell 1 is configured according to Annex C.1.2 and C.1.3.
4. By step 4 of the test procedure:
   - UE is connected to Cell 1 on radio channel 1.
   - UE has bandwidth part BWP-1 in its RRC-configuration for Cell 1.
   - UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in Cell 1.
5. The initial test environment conditions are setup according to clause 19.0.1.

PDCCH and PDSCH maximum number of HARQ transmission		1	
T1	s	0.2	

19.4.3.2.1.4.2 Test procedure

The test consists of 1 time period, with duration of T1.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

Cell 1 has constant signal level throughout the test.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Tables 19.4.3.2.1.4.1-3 and 19.4.3.2.1.5-1. Propagation conditions are set according to Annex C clauses C.2.2.
3. The SS shall send an *RRCReconfiguration* message releasing the dedicated configuration of the *initialDownlinkBWP* and the *initialUplinkBWP*. This message also configures another UE-specific bandwidth part, BWP-1 and indicates BWP-1 as the active DL BWP using *firstActiveDownlinkBWP-Id*, according to the initial condition of Active BWP-1 in Table 19.4.3.2.1.5-1.
4. The UE shall transmit an *RRCReconfigurationComplete* message.
5. The SS shall send an *RRCReconfiguration* message with updated bandwidth part configuration for DL BWP switch, change the BWP according to the final condition of Active BWP-1 in Table 19.4.3.2.1.5-1. T1 starts.
6. The UE shall receive the *RRCReconfiguration* in PCell's slot # denoted i and reconfigure its bandwidth part with the updated bandwidth part configuration.

7 If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot (i + *X* + k1) on BWP-1 of final condition, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one. Where:

- X = 16 for both test configurations 19.4.3.2.1-1 and 19.4.3.2.1-2.

- X = 32 for test configuration 19.4.3.2.1-3.

8. After the SS receives the ACK/NACK in step 7 or when T1 expires, the SS shall transmit *RRCRelease* message to release the RRC connection.

9. After the RRC connection release, the SS:

- transmits in NR Cell 1 a Paging message for the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5 (if the paging fails, switches off and on the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5),
or
- switches off and on the UE and ensures the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* according to TS 38.508-1 [14] clause 4.5.

10. Repeat steps 2-9 until the confidence level according to Annex G clause G.2.3 is achieved.

The test equipment verifies the DL BWP switch time in Cell by counting the time from the time when the RRC Reconfiguration message including updated BWP configuration is sent till the time when a valid ACK/NACK is received.

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in [12].

All of the above test requirements shall be fulfilled in order for the observed Cell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90 %.

19.4.4 UE specific CBW change for ATG

19.4.4.0 Minimum conformance requirements

19.4.4.0.1 Minimum conformance requirements for UE specific CBW change for ATG

The requirements in this clause apply for an ATG UE receiving reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

After the UE receives RRC reconfiguration involving *offsetToCarrier* or *carrierBandwidth* change on the old CBW, UE shall be able to receive PDSCH/PDCCH on the DL BWP with BWP ID firstActiveDownlinkBWP-Id or transmit PUSCH on the UL BWP with BWP ID firstActiveUplinkBWP-Id of the new CBW right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

- DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and
- $T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in milliseconds as defined in TS 36.331 [29] clause 11.2 is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in milliseconds as defined in TS 38.331 [13] clause 12, and
- $T_{CBWchangeDelayRRC} = 6ms$ is the time used by the UE to perform CBW change.

The UE is not required to transmit UL signals or receive DL signals during the above defined time duration $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ on the cell where UE-specific CBW change occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where T_{HARQ} is the time between DL data transmission and acknowledgement as specified in TS 38.213 [8].

The normative reference for this requirement is TS 38.133 [6] clause 8.13D.

19.4.4.1 NR SA FR1 UE specific CBW change on PCell in non-DRX for ATG

Editor's note: This test is incomplete in the following aspects:

- Speed setting is FFS.
- Antenna array is FFS.

19.4.4.1.1 Test purpose

The purpose of this test is to verify the UE specific CBW change delay requirement defined in clause 19.4.4.0.1.

19.4.4.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards.

19.4.4.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.4.0.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.4.1.

19.4.4.1.4 Test description

The test scenario comprises of one Cell, PCell (Cell 1), which has constant signal levels throughout the test. The test consists of 1 time period with duration of T1.

During T1,

Time period T1 starts when a *RRCReconfiguration* containing *SCS-SpecificCarrier* with updated UE specific CBW, sent from the test equipment to the UE, is completely received at the UE side in PCell's slot # denoted *i*. The UE shall reconfigure its UE specific CBW with the updated CBW-2 for the final condition.

The UE shall be able to receive PDSCH on PCell from the first DL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ as defined in clause 19.4.4.0 and starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length} + k1$ on the PCell's BWP-1 on CBW-2 for the final condition. The UE shall be continuously scheduled on the PCell's BWP-1 on CBW-2 for the final condition starting from the first DL slot right after slot $i + \frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$.

$T_{RRCprocessingDelay}$ and $T_{CBWchangeDelayRRC}$ are defined in clause 19.4.4.0.

The test equipment verifies the UE specific CBW switching delay in PCell by estimating the time from the moment the RRC Reconfiguration message including updated UE specific CBW configuration is sent until the moment a vaild ACK/NACK is received.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

19.4.4.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.4.4.1.4.1-1.

1. The general test parameter settings are set up according to Table 19.4.4.1.4.1-3.
2. Message contents are defined in clause 19.4.4.1.4.3.
3. There is one NR carrier and one NR cells specified in the test. Cell 1 is the NR cell used for connection setup with the power level set according to Annex C.1.2 and C.1.3 for this test.
4. By step 3 of the test procedure:
   - UE is connected to Cell 1 (PCell) on radio channel 1.
   - UE has bandwidth part BWP-1 in its RRC-configuration for Cell 1 (PCell).

- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in PCell.
- UE has been configured with UE specific CBW (CBW-1).
- UE is indicated in *SCS-SpecificCarrier* [13] that the UE specific CBW is CBW-1 as the initial condition in Cell 1 (PCell).

5. The initial test environment conditions are setup according to clause 19.0.1.

19.4.4.1.4.2 Test procedure

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Tables 19.4.4.1.4.1-3 and 19.4.4.1.5-1. Propagation conditions are set according to Annex C clauses C.2.2.
3. The SS starts sending PDCCHs indicating new transmissions continuously on Cell 1 to ensure that the UE sends ACK/NACK during the test.
4. The SS sends an *RRCReconfiguration* message containing *SCS-SpecificCarrier* with updated UE specific CBW (CBW-2), dedicated BWP (BWP-1) and *firstActiveDownlinkBWP-Id* indicating BWP-1 is the active BWP.
5. T1 starts from the beginning of slot i, where slot i is the last slot carrying the PDSCH containing the *RRCReconfiguration* message in step 4. The SS shall continuously schedule the PCell's BWP-1 on CBW-2 starting from the first DL slot right after slot ($i + \frac{T_{RRCprocessingDelay} + T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$).
6 If the UE starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay} + T_{CBWchangeDelayRRC}}{NR\ Slot\ length} + k1$, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
7. After the SS receives the ACK/NACK in step 6 or when T1 expires, the SS shall transmit *RRCRelease* message to release the RRC connection which includes the release of the established radio bearers as well as all radio resources. Then the SS shall switch off and then on the UE.
8. Repeat steps 1-7 until the confidence level according to Annex G clause G.2.3 is achieved.

19.4.5 Pathloss reference signal switching delay for ATG

19.4.5.0 Minimum conformance requirements

19.4.5.0.1 Minimum conformance requirements for Pathloss reference signal switching delay for ATG

The requirements in this clause apply for pathloss reference signal activated or updated on serving cell in TS 38.213 [8] in clause 7.1.1.

ATG UE shall complete the switch of pathloss reference signal within the delay defined in this clause.

In FR1, the pathloss reference signal is known if the following conditions is met

- The target pathloss reference signal remains detectable during the pathloss reference signal switching period
  - SNR of the target pathloss reference signal ≥-3 dB

Otherwise, the pathloss reference signal is unknown.

The requirements in this clause apply for a UE to update a pathloss reference signal by MAC-CE for PUCCH, PUSCH, semi-persistent SRS and aperiodic SRS.

If the target pathloss reference signal is known, upon receiving PDSCH carrying MAC-CE activation in slot n, UE shall be able to apply the target pathloss reference signal of the serving cell on which pathloss reference signal switch occurs no later than the slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM * \left\lceil \frac{5 * T_{target_PL-RS} + 2\ ms}{NR\ slot\ length} \right\rceil$. The UE shall be able to apply old pathloss reference signals until the slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu}$. Where

- T_{HARQ} is the timing between pathloss reference MAC-CE activation command and acknowledgement as specified in TS 38.321 [12].
- NM = 1, if the target PL-RS is not maintained by the UE, 0 otherwise.

NOTE: longer application time is expected if measurement sample is not available due to measurement gap, DRX or other UE activities.

NOTE: longer application time is expected if the pathloss reference signal is unknown.

The normative reference for this requirement is TS 38.133 [6] clause 8.14D.

19.4.5.1 NR SA FR1 MAC-CE based pathloss reference signal switch delay for ATG

Editor's note: This test case has been completed for the following configurations:

- Speed setting is FFS.
- Antenna array is FFS.

19.4.5.1.1 Test purpose

The purpose of this test is to verify the MAC-CE based pathloss reference signal switch delay requirement defined in clause 19.4.5.0.1.

19.4.5.1.2 Test applicability

This test applies to all types of NR ATG UE release 18 onwards.

19.4.5.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.4.5.0.

The normative reference for this requirement is TS 38.133 [6] clause A.19.4.5.1.

19.4.5.1.4 Test description

The test scenario comprises of one Cell, PCell (Cell 1).

During T1,

- The UE shall track SSB #1 so that SSB #1 as a pathloss reference signal is known to the UE.

Time period T2 starts when the UE is configured of the power headroom reporting functionality by upper layers by the test equipment and the UE shall transmit a PHR during T2.

During T2,

- UE is configured with a *phr-ProhibitTimer* timer value for Cell 1.
- UE is configured with a *phr-Tx-PowerFactorChange* value for Cell 1.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

19.4.5.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.4.5.1.4.1-1.

19.4.5.1.4.2 Test procedure

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

The test equipment verifies the pathloss RS switch time by counting the slots from the time when the pathloss RS switch command is transmitted till a PHR is received during T3.

The SS shall provide continuous uplink transmission grants during T2 and T3.

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.

2. Set the parameters according to Tables 19.4.5.1.4.1-3 and 19.4.5.1.5-1. Propagation conditions are set according to Annex C clauses C.2.2. T1 starts

3. During T1 both SSB0 and SSB1 are transmitting. The UE shall be able to detect SSB1 such that it becomes a known candidate pathloss reference signal to the UE. The UE starts transmitting CSI reports containing L1-RSRP measurements for both SSB0 and SSB1.

4. The SS shall transmit an *RRCReconfiguration* message on Cell1 configuring the UE with power headroom reporting functionality as specified in 19.4.5.1.4.3.

5. The UE shall transmit an *RRCReconfigurationComplete* message. T2 starts.

6. During T2, UE shall transmit a PHR. If the UE does not send any PHR during T2, proceed with step 9.

7. The SS shall transmit a PDSCH carrying MAC-CE command updating the pathloss reference signal from SSB0 to SSB1. The last TTI slot in which this command is received at the UE side in Cell 1 is denoted as slot *i*. T3 starts at slot *i*.

8. The UE shall switch its pathloss reference signal from SSB0 to SSB1. This will cause an UE-estimated pathloss change larger than *phr-Tx-PowerFactorChange* as described in Table 19.4.5.1.4.3-2, triggering the transmission of another PHR:

- The UE shall send the PHR for PCell no earlier than the slot $i + T_{HARQ} + 3\mathrm{N}_{\mathrm{slot}}^{\mathrm{subframe},\mu}$.
- The UE shall send the PHR for PCell no later than the slot $i + T_{HARQ} + \left\lceil \frac{3\ \mathrm{ms} + 5 * T_{target_PL-RS} + 2\ \mathrm{ms}}{NR\ slot\ length} \right\rceil$

In addition, the UE shall continue transmitting L1-RSRP measurements for both SSB0 and SSB1.

If the above requirements are fulfilled, the number of successful tests is increased by one. Otherwise, count a fail for the test.

9. Switch off and then on the UE. Then proceed with step 10.
10. Repeat steps 1-8 until the confidence level according to Annex G clause G.2.3 is achieved.

NOTE 1: OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.				
NOTE 2: The signal contains PDCCH for UEs other than the device under test as part of OCNG.				
NOTE 3: SNR levels correspond to the signal to noise ratio over the SSS REs.				
NOTE 4: The DL PDSCH reference measurement channel is used in the test only when a downlink transmission dedicated to the UE under test is required.				
NOTE 5: SS-RSRP, Es/Iot and Io levels have been derived from other parameters for information purpose. They are not settable parameters.				

During During T3, the UE shall start to send the PHR for PCell no later than the slot $i + T_{HARQ} + \left\lceil \frac{3\text{ ms} + 5 * T_{target_PL-RS} + 2\text{ ms}}{NR\ slot\ length} \right\rceil$.

During T3, the UE shall start to send the PHR for PCell no earlier than the slot $i + T_{HARQ} + 3\text{N}_{\text{slot}}^{\text{subframe},\mu}$.

Where, T_{HARQ} is the timing between pathloss reference MAC-CE activation command and acknowledgement as specified in [12], T_{target_PL-RS} is the periodicity of the target pathloss reference signal which is SSB in this test.

During T3, UE shall send L1-RSRP report with measurement results for both SSB0 and SSB1.

All of the above test requirements shall be fulfilled in order for the observed pathloss RS switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The UE shall be given proper uplink transmission grant during T2 and T3.19.5 Measurement procedure for ATG

19.5.1 Intra-frequency measurements

19.5.1.0 Minimum conformance requirements

19.5.1.0.1 Minimum conformance requirements for Intra-frequency measurements without measurement gaps

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index}$.

$$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra})\ \text{ms}$$

$$T_{identify_intra_with_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra})\ \text{ms}$$

Where:

T_{PSS/SSS_sync_intra}: it is the time period used in PSS/SSS detection given in Table 19.5.1.0.1-1.

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 19.5.1.0.1-2.

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 19.5.1.0.1-3.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in TS 38.133 [6] clause 9.1D.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap,i}$ in TS 38.133 [6]

clause 9.1D.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

If the high layer in TS 38.331 [13] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

When UE supports *concurrentMeasGap-r17* and is configured with concurrent measurement gaps,

K_p is the scaling factor for an SSB frequency layer to be measured without measurement gaps. $K_p = N_{total} / N_{available}$, where $N_{available}$ and N_{total} are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:
  - N_{total} is the total number of SMTC occasions within the window, including those overlapped with measurement gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are not overlapped with any non-dropped MG occasion within the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3.

    $K_p = 1$ when $N_{available} = 0$.
- Otherwise, when UE is not configured with or UE does not support concurrent measurement gaps:

  When intra-frequency SMTC is fully non overlapping with measurement gaps or NCSG, or intra-frequency SMTC is fully overlapping with MGs or NCSG, K_p=1

  When intra-frequency SMTC is partially overlapping with measurement gaps, K_p = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. When intra-frequency SMTC is partially overlapping with NCSG, K_p = 1/(1- (SMTC period /VIRP)), where SMTC period < VIRP. For calculation of K_p, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*. If the higher layer signaling in TS 38.331 [13] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$

For UE capable of *antennaArrayType-r18*,

$K_{layer1_measurement}$=1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged. and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

Otherwise, $K_{layer1_measurement}$=1.

The measurement period for intra-frequency measurements without gaps is as shown in table 19.5.1.0.1-3.

If the higher layer signaling in TS 38.331 [13] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra}$

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

Otherwise, N1 = 1.	

19.5.1.0.2 Minimum conformance requirements for Intra-frequency measurements with measurement gaps

When a measurement gap is provided or an activated Pre-MG is provided without any pre-MG status changed during the measurement period, the UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index.}$ The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index.}$

$$T_{identify_intra_without_index} = T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra}\ ms$$

$$T_{identify_intra_with_index} = T_{PSS/SSS_sync_ntra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra}\ ms$$

Where:

- T_{PSS/SSS_sync_intra}: it is the time period used in PSS/SSS detection given in table 19.5.1.0.2-1.
- $T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 19.5.1.0.2-2.
- $T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 19.5.1.0.2-3.
- $CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in TS 38.133 [6] clause 9.1D.5.2 for measurement conducted within measurement gaps.
- K_{gap} is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap} = 1$ when the UE is not configured with concurrent measurement gaps. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and N_{total} are calculated as follows:
  - For a window W of duration max(SMTC period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:
  - N_{total} is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for measurement gap collisions by applying the measurement gap collision rule in TS 38.133 [6] clause 9.1.8.3.

  When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available} = 0$.

If the higher layer signaling in TS 38.331 [13] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$.

The requirements in this clause apply when a measurement gap is provided or when an activated Pre-MG is provided without any pre-MG status changed during the measurement period.

The measurement period for FR1 intra frequency measurements with gaps is as shown in table 19.5.1.0.2-3.

Longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

19.5.1.1 SA FR1 event triggered reporting tests without gap without SSB index reading under non-DRX

Editor's note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT Command to set the UE speed is not specified.
- The specific gNB reference location is missing.
- Antenna array is FFS.

19.5.1.1.1 Test purpose

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in 38.133 [6] clauses 9.2D.5.1 and 9.2D.5.2.

19.5.1.1.2 Test applicability

This test applies to all types of NR ATG UE from release 18.

19.5.1.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.5.1.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.5.1.1.

19.5.1.1.4 Test description

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2. A measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

19.5.1.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.5.1.1.4.1-1

Table 19.5.1.1.4.1-1: Supported test configurations

Configuration	Description
19.5.1.1-1	FDD duplex mode, 15 kHz SSB SCS, 10 MHz bandwidth
19.5.1.1-2	TDD duplex mode, 15 kHz SSB SCS, 10 MHz bandwidth
19.5.1.1-3	TDD duplex mode, 30 kHz SSB SCS, 40 MHz bandwidth
NOTE: The UE is only required to pass in one of the supported test configurations	

Test environment parameters are given in Table 19.5.1.1.4.1-2.

19.5.1.2 SA FR1 event triggered reporting tests with per-UE gaps under non-DRX

Editor's note: This test case is incomplete in following aspects:

- TT analysis is missing.
- AT Command to set the UE speed is not specified.
- The specific gNB reference location is missing.
- Antenna array is FFS.

19.5.1.2.1 Test purpose

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in 38.133 [6] clauses 9.2D.6.2 and 9.2D.6.3.

19.5.1.2.2 Test applicability

This test applies to all types of NR ATG UE from release 18.

19.5.1.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.5.1.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.19.5.1.2.

19.5.1.2.4 Test description

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2. A measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

19.5.1.2.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.5.1.2.4.1-1

19.5.2 Inter-frequency measurements

19.5.2.0 Minimum conformance requirements

19.5.2.0.1 Minimum conformance requirements for Inter-frequency measurements with measurement gaps

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured for the FR1 target frequency layers and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

T_{PSS/SSS_sync_inter}: it is the time period used in PSS/SSS detection given in table 19.5.2.0.1-1.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 19.5.2.0.1-2.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 19.5.2.0.1-3.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in TS 38.133 [6] clause 9.1D.5.2 for measurement conducted within measurement gaps.

K_{gap} is a scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. K_{gap} = 1 when the UE is not configured with concurrent measurement gaps. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and N_{total} are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap(s), and starting from the beginning of any SMTC occasion:
  - N_{total} is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W, after accounting for collisions between the measurement gaps by applying the measurement gap collision rule in TS 38.133 [6] clause 9.1.8.3.

K_{gap} is only applicable for UE supporting *concurrentMeasGap-r17*. When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available}$ =0.

Condition NOTE1	T_{PSS/SSS_sync_inter}
No DRX	$Max(600\ ms, Ceil(8 * K_{gap} \times N1^{Note\ 3}) \times Max(MGRP, SMTC\ period)) \times CSSF_{inter}$

DRX cycle > 320 ms	$Ceil(8 * K_{gap} \times N1^{Note\ 3}) \times DRX\ cycle \times CSSF_{inter}$
NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 NOTE 2: For a UE supporting concurrent gaps, the MRGP above is the MRGP of the measurement gap associated with the target frequency layer to be measured if concurrent measurement gaps are configured. NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.

DRX cycle > 320 ms	$Ceil(3 * K_{gap} \times N1^{Note\ 3}) \times DRX\ cycle \times CSSF_{inter}$
NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 NOTE 2: For a UE supporting concurrent gaps, the MRGP above is the MRGP of the measurement gap associated with the target frequency layer to be measured if concurrent measurement gaps are configured. NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.	

When measurement gaps are provided for inter-frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-

SINR measurements to higher layers with measurement accuracy as specified in TS 38.133 [6] clauses 10.1.4, 10.1.9, and 10.1.14, respectively, as shown in table 19.5.2.0.1-3.

DRX cycle > 320 ms	Ceil(8 * K_{gap} x N1 Note 3) × DRX cycle × $CSSF_{inter}$
NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 NOTE 2: For a UE supporting concurrent gaps, the MRGP above is the MRGP of the measurement gap associated with the target frequency layer to be measured if concurrent measurement gaps are configured. NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.	

19.5.2.0.2 Minimum conformance requirements for Inter-frequency measurements without gaps

UE satisfying the applicability conditions specified in TS 38.133 [6] clause 9.3D.1 on the requirement in this clause shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured for the FR1 and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

- T_{PSS/SSS_sync_inter}: it is the time period used in PSS/SSS detection given in table 19.5.2.0.2-1.
- $T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 19.5.2.0.2-2.
- $T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 19.5.2.0.2-3.
- $CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in TS 38.133 [6] clause 9.1D.5.1 for measurement conducted outside measurement gaps, i.e. when inter-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps or according to $CSSF_{within_gap,i}$ in TS 38.133 [6] clause 9.1D.5.2 for measurement conducted within measurement gaps, i.e. when inter-frequency SMTC is fully overlapping with measurement gaps.

For inter-frequency SSB based measurements without measurement gaps in active BWP.

M_{pss/sss_sync_inter}: For FR1, $M_{pss/sss_sync_inter} = 5$.

$M_{SSB_index_inter}$: For FR1, $M_{SSB_index_inter} = 3$.

$M_{meas_period_inter}$: For FR1, $M_{meas_period_inter} = 5$.

K_p is a scaling factor for an SSB frequency layer to be measured without measurement gaps. $K_p = N_{total} / N_{available}$, where $N_{available}$ and N_{total} are calculated as follows:

For a window W of duration max(SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG, and starting at the beginning of any SMTC occasion:

N_{total} is the total number of SMTC occasions within the window, including those overlapped with MG occasions within the window, and

$N_{available}$ is the number of SMTC occasions that are not overlapped with any non-dropped MG occasion within the window W, after accounting for MG collisions by applying the selected gap collision rule provided that concurrent measurement gaps are configured.

$K_p = 1$ when $N_{available} = 0$.

Otherwise, when UE is not configured with or UE does not support concurrent measurement gaps:

When inter-frequency SMTC is fully non overlapping with measurement gaps, or inter-frequency SMTC is fully overlapping with MGs, K_p =1.

When inter-frequency SMTC is partially overlapping with measurement gaps, K_p = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. When inter-frequency SMTC is partially overlapping with NCSG, K_p = 1/(1- (SMTC period /VIRP)), where SMTC period < VIRP.

For UE capable of *antennaArrayType-r18*,

$K_{layer1_measurement}$=1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap are not fully overlapped by inter-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap and fully-overlapped by inter-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged. and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$=1.5, otherwise.

Otherwise, $K_{layer1_measurement}$=1.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

For calculation of K_p, if the high layer signalling (TS 38.331 [13]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

DRX cycle>320 ms	ceil($M_{meas_period_inter}$ x K_p x N1 [Note 2] x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{inter}$
NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified NOTE 2: For ATG UE with the antenna array, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.	

19.5.2.1 SA FR1-FR1 event triggered reporting tests without SSB time index detection when DRX is used

Editor's note: This test case is incomplete in following aspects:

- Test parameters are missing in TS 38.133 [6].
- TT analysis is missing.
- Message contents are FFS.
- Test procedure is missing.
- AT Command to set the UE speed is not specified.
- The specific gNB reference location is missing.
- Antenna array is FFS.

19.5.2.1.1 Test purpose

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in TS 38.133 [6] clause 9.3D.4.

19.5.2.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18.

19.5.2.1.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.5.2.0.1.

The normative reference for this requirement is TS 38.133 [6] clause A.19.5.2.1.

19.5.2.1.4 Test description

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2. A measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used.

UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.

The specific gNB reference location is emulated by test system.

19.5.2.1.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.5.2.1.4.1-1

TBD

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1080 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 10240 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 % with the confidence level of 95%.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

19.5.4.2 NR SA FR1 L1-SINR measurement with SSB based CMR and dedicated IMR in non-DRX for ATG

Editor's note: This test case is incomplete in following aspects.

- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.5.4.2.1 Test purpose

To verify that the UE makes correct reporting of L1-SINR measurement in non-DRX within L1-SINR measurement requirements in TS 38.133 [6] clause 9.8.4.2.

19.5.4.2.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward and supporting L1-SINR measurement.

19.5.4.2.3 Minimum conformance requirements

The minimum conformance requirements are specified in clause 19.5.4.0.2.

19.6 Measurement Performance requirements for ATG

19.6.0 General

19.6.0.1 Principles of testing for ATG UE

Unless explicitly stated otherwise:

- Reported measurements shall be within defined range of accuracy limits defined in clause 10 for at least 90 % of the reported cases. If multiple measurement performance requirements are verified in the same test, the reported measurements for each requirement shall be within defined range of accuracy limits of the corresponding requirement defined in clause 10 for at least 90 % of the reported cases.
- Measurements are performed in RRC_CONNECTED state.
- The reference channels assume transmission of PDSCH with a maximum number of 5 HARQ transmissions unless otherwise specified.

19.6.1 SS-RSRP for ATG

1. Message contents are defined in clause 19.6.6.1.1.4.3.
2. There are two cells on the same frequency. Cell 1 is the PCell, and Cell 2 is the target cell for CSI-RSRP measurements.
3. During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.
4. During the test, the specific gNB reference location is emulated by test system.
5. The initial test environment conditions are setup according to clause 19.0.1.

19.6.6.1.1.4.2 Test procedure

1. Ensure that the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Table 19.6.6.1.1.5-1 as appropriate.
3. The SS shall transmit an *RRCReconfiguration* message on Cell 1 to configure periodical measurement reporting.
4. The UE shall transmit an *RRCReconfigurationComplete* message.
5. The UE shall transmit *MeasurementReport* messages periodically.
6. After 10s wait from Step 3, the SS shall check the CSI-RSRP reported values in the periodic *MeasurementReport*.
   - If the value is outside the limits in Table 19.6.6.1.1.5-2 or Table 19.6.6.1.1.5-3, or
   - the UE fails to report the measurement value for Cell 2,
   - the number of failed iterations is increased by one. Otherwise, the number of passed iterations is increased by one.

7. The SS shall continue checking the *MeasurementReport* messages transmitted by the UE until the confidence level according to Table G.2.3-1 in Annex G is achieved.

8. Set the parameters according to each sub-test in Table 19.6.6.1.1.5-1 as appropriate and repeat steps 5-7.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.

NOTE 3: CSI-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: CSI-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Subtest 1 is not used when testing with 30 kHz SSB and CSI-RS SCS.
NOTE 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification

19.6.6.1.2 NR SA FR1 CSI-RSRP relative measurement accuracy for ATG

Editor's note: This test case is incomplete in following aspects.

- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.6.6.1.2.1 Test purpose

The purpose of this test is to verify that the CSI-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clause 10.1.2.3.2 for CSI-RS intra-frequency measurements

19.6.6.1.2.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based RSRP and RSRQ measurement.

19.6.6.1.2.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 19.6.6.0.2.

The normative reference for this requirement is TS 38.133 [6] clause A.19.6.6.1.

19.6.6.1.2.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.6.6.1.2.4.1-1.

Table 19.6.6.1.2.4.1-1: Supported test configurations

Configuration	Description
19.6.6.1.2-1	NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, FDD duplex mode
19.6.6.1.2-2	NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, TDD duplex mode
19.6.6.1.2-3	NR 30 kHz SSB and CSI-RS SCS, 40 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Configure the test equipment and the DUT according to the parameters in Table 19.6.6.1.2.4.1-2.

1. Message contents are defined in clause 19.6.6.1.2.4.3.
2. There are two cells on the same frequency. Cell 1 is the PCell, and Cell 2 is the target cell for CSI-RSRP measurements.
3. During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.
4. During the test, the specific gNB reference location is emulated by test system.
5. The initial test environment conditions are setup according to clause 19.0.1.

19.6.6.1.2.4.2 Test procedure

1. Ensure the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity NR Connected without release On and Test Mode On according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Table 19.6.6.1.2.5-1 as appropriate.
3. The SS shall transmit an *RRCReconfiguration* message on Cell 1 to configure periodical measurement reporting.
4. The UE shall transmit an *RRCReconfigurationComplete* message.
5. The UE shall transmit *MeasurementReport* messages periodically.
6. After 10s wait from Step 3, the SS shall compare the CSI-RSRP reported values of Cell 1 and Cell 2 in the periodic *MeasurementReport*.
   - If the resulting value is outside the limits in Table 19.6.6.1.2.5-2, or

- the UE fails to report the measurement value for Cell 1 or Cell 2,
- the number of failed iterations is increased by one. Otherwise, the number of passed iterations is increased by one.

7. The SS shall continue checking the *MeasurementReport* messages transmitted by the UE until the confidence level according to Table G.2.3-1 in Annex G is achieved.
8. Set the parameters according to each sub-test in Table 19.6.6.1.2.5-1 as appropriate and repeat steps 5-7.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 3: CSI-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: CSI-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

19.6.7 CSI-RSRQ for ATG

19.6.7.0 Minimum conformance requirements

19.6.7.0.1 Intra-frequency CSI-RSRQ absolute accuracy requirements for ATG

Same as the minimum conformance requirements given in clause 4.7.9.0.1.1.

19.6.7.0.2 Inter-frequency CSI-RSRQ absolute accuracy requirements for ATG

Same as the minimum conformance requirements given in clause 4.7.9.0.2.1.

19.6.7.0.3 Inter-frequency CSI-RSRQ relative accuracy requirements for ATG

Same as the minimum conformance requirements given in clause 4.7.9.0.2.2.

19.6.7.1 NR SA FR1 CSI-RSRQ absolute measurement accuracy for ATG

Editor's note: This test case is incomplete in following aspects.

- AT commands for UE positioning and UE speed setting are FFS.
- The specific gNB reference location emulated by test system is FFS.
- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.6.7.1.1 Test purpose

The purpose of this test is to verify that the CSI-RSRQ measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clause 10.1.7.2 for CSI-RS intra-frequency measurements.

19.6.7.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based RSRP and RSRQ measurement.

19.6.7.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 19.6.7.0.1.

The normative reference for this requirement is in TS 38.133 [6] clause A.19.6.7.1.

1. Message contents are defined in clause 19.6.7.2.4.3.
2. In this test case all cells are on the same carrier frequency. Cell 1 is the NR serving cell (PCell). Cell 2 is an NR FR1 cell in the same frequency as Cell 1. Cell 2 is the target cell for CSI-RSRQ measurements.
3. During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.
4. During the test, the specific gNB reference location is emulated by test system.
5. The initial test environment conditions are setup according to clause 19.0.1.

19.6.7.1.4.2 Test procedure

1. Ensure that the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity NR, Connected without release On and Test Mode On according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Table 19.6.7.1.5-1 as appropriate.
3. The SS shall transmit an *RRCReconfiguration* message on Cell 1 to configure periodical measurement reporting.
4. The UE shall transmit an *RRCReconfigurationComplete* message.
5. The UE shall transmit *MeasurementReport* messages periodically.
6. After 10s wait from Step 3, the SS shall check the CSI-RSRQ reported values in the periodic *MeasurementReport*.

- If the value is outside the limits in Table 19.6.7.1.5-2, or
- the UE fails to report the measurement value for Cell 2,
- the number of failed iterations is increased by one. Otherwise, the number of passed iterations is increased by one.

7. The SS shall continue checking the *MeasurementReport* messages transmitted by the UE until the confidence level according to Table G.2.3-1 in Annex G is achieved.
8. Set the parameters according to each sub-test in Table 19.6.7.1.5-1 as appropriate and repeat steps 5-7.

- Test procedures for providing network assistance on ATG cells reference locations are FFS.

19.6.8.1.1 Test purpose

The purpose of this test is to verify that the CSI-SINR measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clause 10.1.12.2.1 for CSI-RS intra-frequency measurements.

19.6.8.1.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based SINR measurements.

19.6.8.1.3 Minimum conformance requirements

The minimum conformance requirements are defined in Clause 19.6.8.0.1.

The normative reference for this requirement is in TS 38.133 [6] A.19.6.8.1.

3. During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.
4. During the test, the specific gNB reference location is emulated by test system.
5. The initial test environment conditions are setup according to clause 19.0.1.

19.6.8.1.4.2 Test procedure

1. Ensure that the UE is in state RRC_CONNECTED with generic procedure parameters Connectivity *NR*, Connected without release *On* and Test Mode *On* according to TS 38.508-1 [14] clause 4.5.
2. Set the parameters according to Table 19.6.8.1.5-1 as appropriate.
3. The SS shall transmit an *RRCReconfiguration* message on Cell 1 to configure periodical measurement reporting.
4. The UE shall transmit an *RRCReconfigurationComplete* message.
5. The UE shall transmit *MeasurementReport* messages periodically.
6. After 10s wait from Step 3, the SS shall check the CSI-SINR reported values in the periodic *MeasurementReport*.
   - If the value is outside the limits in Table 19.6.8.1.5-2; or
   - the UE fails to report the measurement value for Cell 2;
   - the number of failed iterations is increased by one. Otherwise, the number of passed iterations is increased by one.
7. The SS shall continue checking the *MeasurementReport* messages transmitted by the UE until the confidence level according to Table G.2.3-1 in Annex G is achieved.
8. Set the parameters according to each sub-test in Table 19.6.8.1.5-1 as appropriate and repeat steps 5-7.

19.6.8.2.2.1 Test purpose

The purpose of this test is to verify that the inter-frequency CSI-SINR relative measurement accuracy is within the specified limits. This test will verify the requirements in TS 38.133 [6] clauses 10.1.14.2.2.

19.6.8.2.2.2 Test applicability

This test applies to all types of NR ATG UE from Release 18 and forward supporting CSI-RS based SINR measurements.

19.6.8.2.2.3 Minimum conformance requirements

The minimum conformance requirements are defined in clause 19.6.8.0.3.

The normative reference for this requirement is TS 38.133 [6] clause A.19.6.8.2.

19.6.8.2.2.1.4 Test description

19.6.8.2.2.4.1 Initial conditions

This test shall be tested using any of the test configurations in Table 19.6.8.2.2.4.1-1.

Table 19.6.8.2.2.4.1-1: Supported test configurations

Configuration	Description
19.6.8.2.2-1	NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, FDD duplex mode
19.6.8.2.2-2	NR 15 kHz SSB and CSI-RS SCS, 10 MHz bandwidth, TDD duplex mode
19.6.8.2.2-3	NR 30 kHz SSB and CSI-RS SCS, 40 MHz bandwidth, TDD duplex mode
Note: The UE is only required to be tested in one of the supported test configurations.	

Configure the test equipment and the DUT according to the parameters in Table 19.6.8.2.2.4.1-2.

Table 19.6.8.2.2.4-2: Initial conditions

Parameter	Value		Comment
Test environment	NC, TL/VL, TL/VH, TH/VL, TH/VH		As specified in TS 38.508-1 [14] clause 4.1.
Test frequencies	As specified in Annex E, Table E.17-1 and TS 38.508-1 [14] clause 4.3.1.		
Channel bandwidth	As specified by the test configuration selected from Table 19.6.8.2.2.4.1-1.		
Propagation conditions	AWGN		As specified in Annex C.2.2.
Connection Diagram	TE Part 2Rx	A.3.1.8.2 with n = 2 and φ_1 = 5 Hz	As specified in TS 38.508-1 [14] Annex A.
	TE Part 4Rx	A.3.1.8.5 with n = 2 and $\varphi_{1,1}$ = 5 Hz, $\varphi_{1,2}$ = 10 Hz, $\varphi_{1,3}$ = 15 Hz	
	DUT Part 2Rx	A.3.2.3.4	
	DUT Part 4Rx	A.3.2.5.2	
Exceptions to connection diagram	- Without LTE link		

1. Message contents are defined in clause 19.6.8.2.2.4.3.
2. There are two cells on the same frequency. Cell 1 is the PCell, and Cell 2 is the target cell for CSI-SINR measurements.
3. During the test, UE positioning and UE speed are set by AT command. UE speed is 0km/h, UE specific positioning is emulated by test system.
4. During the test, the specific gNB reference location is emulated by test system.

19.6.8.2.2.4.3 Message contents

Same as the message contents given in clause 19.6.8.2.1.4.3.

19.6.8.2.2.5 Test requirement

Table 19.6.8.2.2.5-1 defines the primary level settings including test tolerances for all tests.

Each CSI-SINR measurement report for each of the tests shall meet the corresponding relative accuracy requirements in Table 19.6.8.2.2.5-2.

Table 19.6.8.2.2.5-1: Same as Table 6.7.1.1.1.5-1

Table 19.6.8.2.2.5-2: CSI-SINR Inter-frequency relative accuracy requirements for the reported values

Normal Conditions	**Test 1 All bands**	**Test 2 All bands**	**Test 3 All bands**
Lowest reported value (Cell 2)	SINR_x - TT	SINR_x - TT	SINR_x - TT
Highest reported value (Cell 2)	SINR_x - TT	SINR_x - TT	SINR_x - TT
Extreme Conditions	**Test 1 All bands**	**Test 2 All bands**	**Test 3 All bands**
Lowest reported value (Cell 2)	SINR_x - TT	SINR_x - TT	SINR_x - TT
Highest reported value (Cell 2)	SINR_x - TT	SINR_x - TT	SINR_x - TT
Note 1: SINR_x is the reported value of Cell 1			

For the test to pass, the ratio of successful reported values in each test shall be more than 90% with a confidence level of 95%.

Annex A (normative): RRM test configurations

A.1 Reference measurement channels

A.1.0 General

This clause contains the Reference Measurement Channels (RMC) to be used for the RRM test scenarios in Clauses 4 to 18 of this document.

A.1.1 PDSCH

A.1.1.1 FDD

Table A.1.1.1-1: PDSCH Reference Measurement Channels for SCS = 15 kHz for FDD

Parameter	Unit	Value	
Reference channel		SR.1.1 FDD	SR.1.2 FDD
Channel bandwidth	MHz	Defined in test case	Defined in test case by the parameter $N_{RB,c}$

For slots without RMSI	Bits	1864	1864
Number of Code Blocks per slot		1	1
Binary Channel Bits Per slot			
For slots with RMSI Note 2, 4	Bits	5184	5184
For slots without RMSI Note 6	Bits	6048	6048

NOTE 1: Allocated outside the SMTC duration in time and in resource blocks which do not overlap with the resource blocks allocated for SS/PBCH block.
NOTE 2: PDSCH is scheduled on the slots with RMSI.
NOTE 3: If necessary, the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in 3GPP TS 38.213 [8].
NOTE 4: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditonalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 2.
NOTE 5: PDSCH is not scheduled in slots containing SSB according to the SSB configuration used in the test. SSB configurations are defined in clause A.3.
NOTE 6: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditonalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 1.
NOTE 7: When DRX is configured, PDCCH can be scheduled both for downlink assignment and/or UL grant only during ([10ms] – drx-InactivityTimer) from timing when *drx-onDurationTimer* starts, unless otherwise specified in the test case.

A.1.6 PUSCH

This rule applies to NR cell(s), which the UE is connected to. The UE is in RRC_CONNECTED mode.

When signalling or data payloads are expected to be sent on the PUSCH, the UE may be provided in advance with PUSCH resources by the SS. For sake of simplicity, the PUSCH scheduling may also occur continuously over many consecutive subframes. These options shall not be used if:
1) stated otherwise in the test description, or
2) the transmission of PUSCH and UL scheduling information affects the test purpose (e.g. DRX, PUCCH reception etc.)

A.1A Reference measurement channels under CCA

A.1A.0 General

This clause contains the Reference Measurement Channels (RMC) under CCA to be used for the RRM test scenarios in Clauses 10 to 12 of this document.

A.1A.1 PDSCH

A.1A.1.1 FDD

Table A.1A.1.1-1: PDSCH Reference Measurement Channels under CCA for SCS=30kHz

Parameter	Unit	Value

For slots without RMSI	bits	1864						
Number of Code Blocks per slot		1						
Binary Channel Bits Per slot								
For slots with RMSI Note 2, Note 4	bits	5184						
For slots without RMSI Note 6	bits	6048						

Note 1: Allocated outside the discovery burst transmission window in time and in resource blocks which do not overlap with the resource blocks allocated for SS/PBCH block.
Note 2: PDSCH is scheduled on the slots with RMSI.
Note 3: If necessary the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in TS 38.213 [8].
Note 4: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditonalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 2.
Note 5: PDSCH is not scheduled in slots containing SSB according to the SSB configuration used in the test. SSB configurations are defined in clause A.3A.
Note 6: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditonalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 1.
Note 7: PDSCH is transmitted during the RMC burst as specified in A.1A.5.

A.1A.2 CORESET for RMSI scheduling

A.1A.2.1 TDD

Table A.1A.2.1-1: RMSI CORESET Reference Channel under CCA for SCS=30KHz

Note 1: DCI formats are defined in TS 38.212 [31].
Note 2: DCI format shall depend upon the test configuration.
Note 3: The offset is defined with respect to the subcarrier spacing of the CORESET from the smallest RB index of RMSI CORESET to the smallest RB index of the common RB overlapping with the first RB of the SS/PBCH block.
Note 4: The configuration of PDCCH monitoring occasions for RMSI CORESET is defined in Table 13-11 in TS 38.213 [8].
Note 5: Cell ID shall depend upon the test configuration.
Note 6: Payload size shall depend upon the test configuration.
Note 7: The configuration of set of resource blocks and slot symbols of control resource set for Type0-PDCCH search space corresponds to index 4 in Table 13-4A in TS 38.213 [8].
Note 8: Other values can be used to align with GSCN [13] as long as SSB does not overlap the RMC.

A.1A.5 RMC burst transmission model

RMC not conveying RMSI is scheduled during the RMC burst. The length of the transmission burst in slots is defined as N. The burst transmission format is determined according to the steps below:

1. Select N randomly from a given set of the number of slots $S_1 = \{1,3,5\}$ with equal probability as the total length of RMC burst transmission format.

2. A uniform random variable from 0 to 1 is generated. If the random variable is less than P_{CCA_DL}, a burst of N fully occupied slots is transmitted. Otherwise, the RMC burst transmission is muted and the muting duration is the same as the number N of slots for determined burst format.

RMC burst transmission is scheduled outside discovery burst transmission window. If transmission occurred in the previous slot, transmission is muted for a duration of one slot. Additionally, if the start time of the candidate RMC burst transmission is within 5 slots of the start of the discovery burst transmission window, RMC transmission is not performed.

A.2 Reference OCNG configuration

A.2.1 Generic OFDMA channel noise generator (OCNG)

The OCNG pattern is used in a test for modelling the allocation of unused resourced in the channel bandwidth to virtual UEs (UEs that are not under test). The OCNG pattern simulates both PDCCH and PDSCH transmissions to the virtual UEs. For the cells operating under CCA, OCNG is transmitted only in slots with RMC burst transmission and is not transmitted during the slots for which CCA attempt is unsuccessful or during DBT windows.

A.6 EN-DC test setup

The purpose of this Annex is to specify the EN-DC configuration for the test cases in Chapters 4 and 5 of this test specification.

A.6.1 E-UTRA serving cell parameters

This clause defines the cell power levels and other specific cell parameters of the E-UTRA serving cell for EN-DC.

A.6.1.1 E-UTRA serving cell parameters for EN-DC tests with NR FR1

Table A.6.1.1-1 defines the E-UTRA serving cell parameters for EN-DC tests with NR FR1 cell(s), defined in Chapter 4 of this test specification and for iRAT tests with E-UTRA serving cell and NR FR1 cell(s) defined in Chapter 8 of this test specification. Unless otherwise stated within the test, all measurements in Clauses 4 and 5 are performed only on the NR carrier. The E-UTRA PCell shall be configured to not interfere with NR operation and the E-UTRA PCell signal power shall not be critical to the test purpose.

NOTE 2: DL RMCs and OCNG patterns are specified in clauses A.1, A.2 and D.1 of TS 36.521-3 [26].
NOTE 3: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 4: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled.
NOTE 5: Es/Iot, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 6: For E-UTRA anchor configuration, pick 5 MHz as default channel bandwidth setting in the tests as it is supported by all E-UTRA bands. If none of the UE supported EN-DC band combos support 5MHz E-UTRA carrier, pick 20 MHz channel BW or 10 MHz channel BW, in that order,

A.6.1.2 E-UTRA serving cell parameters for EN-DC tests with NR FR2

Table A.6.1.2-1 defines the E-UTRA serving cell parameters for EN-DC tests with NR FR2 cell(s), defined in Chapter 5 of this test specification and for iRAT tests with E-UTRA serving cell and NR FR1 cell(s) defined in Chapter 8 of this test specification. Unless otherwise stated within the test, all measurements in Clauses 5 and 7 are performed only on the NR carrier. The E-UTRA PCell shall configured to not interfere with NR operation and the E-UTRA PCell signal power shall not be critical to the test purpose.

A.6A NR FR1-FR2 test setup

Some test cases in clause 7 have NR cells in both FR1 and FR2. Unless otherwise stated within the test, the NR FR1 Cell signal is required only to provide a link to the UE under test. The Test Equipment shall provide a stable and noise-free NR FR1 signal without need of precise propagation modelling, path loss and polarization control. Further details of the NR FR1 signal configuration are not defined as part of the cell specific test parameters, since the NR FR1 link is not under performance verification and is not expected to influence the test purpose.

A.6B EN-DC test setup with unlicensed bands

A.6B.1 E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) under CCA in FR1

Table A.6B.1-1 defines cell specific test parameters for E-UTRAN cell which can be used in EN-DC test cases or in any test case comprising at least one E-UTRA serving cell with all NR cells under CCA in FR1. Unless otherwise stated within the test, all measurements are performed only on the unlicensed NR carrier. The E-UTRA serving cell shall configured to not interfere with NR operation and the E-UTRA serving cell signal power shall not be critical to the test purpose.

A.7 Reference PRACH configurations

This clause provides the typical PRACH configurations used for all RRM test cases defined in this test specification. Parameters not listed in this clause can be derived from the configuration of each test.

A.7.1 PRACH configurations for FR1

Table A.7.1-1 defines the PRACH configurations for FR1. Each of the PRACH configurations defined in Table A.7.1-1 have different applicabilities:

- PRACH.1 FR1 for SSB-based contention based random access in FR1.
- PRACH.2 FR1 for SSB-based non-contention based random access in FR1.
- PRACH.3 FR1 for CSI-RS based non-contention based random access in FR1.
- PRACH.4 FR1 for CSI-RS based non-contention based random access in FR1 to convey BFR.
- PRACH.6 FR1 for SSB-based contention free random access in FR1.

The PRACH configuration defined in Table A.7.1-2 has the following applicability:

- PRACH.5 FR1 for LTM early UL synchronization on candidate cell in FR1.

A.8 Reference BWP configurations

This clause provides the typical BWP configurations used for RRM test cases defined in this test specification. For downlink BWP, both initial BWP and dedicated BWP configurations are specified in clause A.8.1 and for uplink BWP, dedicated BWP configurations are specified in clause A.8.2. Parameters not listed in this clause can be derived from the configuration of each test.

A.8.1 Downlink BWP configurations

Table A.8.1-1 defines the different downlink initial BWP configurations. Table A.8.1-2 defines the different downlink dedicated BWP configurations.

Table A.8.1-1: Downlink BWP patterns for initial BWP configuration

BWP Parameters	Unit	Values		
DL BWP		**DLBWP.0.1**	**DLBWP.0.2**	
Starting PRB index		0	RB_c Note 1	
Bandwidth		Same as RF channel defined in each test	same as RMSI CORSET(CORE SET #0) defined in each test Note 2	
NOTE 1: RB_c is the lowest PRB index to guarantee the BWP including CORESET #0 which is defined in Clause A.1.2.				
NOTE 2: In case CORESET#0 and SSBs defined in the test do not completely fit into the bandwidth of the reference BWP bandwidth, the latter one is extended to the next smallest size which can fully accommodate the respective CORESET#0 and SSBs.

NOTE 1: RB_b is the lowest PRB index to guarantee the BWP not fully overlapped with SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.																
NOTE 2: RB_a is the lowest PRB index to guarantee the BWP including SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.																
NOTE 3: RB_c is the PRB index having an offset of 6 PRBs with respect to the start of SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.																

A.8.2 Uplink BWP configurations

Table A.8.2-1 defines the uplink initial BWP configurations. Table A.8.2-2 defines the uplink dedicated BWP configurations.

Table A.8.2-1: Uplink BWP patterns for initial BWP configurations

NOTE 2: RB_a is the lowest PRB index to guarantee the BWP including SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3. NOTE 3: RB_c is the PRB index having an offset of 6 PRBs with respect to the start of SSB PRB index (RBJ, RBJ+1,…., RBJ+19) which is defined in Clause A.3.																	

A.8A Reference BWP configurations for RedCap

This clause provides the typical BWP configurations used for RedCap RRM test cases defined in Annex A. RedCap downlink dedicated BWP configurations are specified in clause A.8A.1 and RedCap uplink dedicated BWP configurations are specified in clause A.8A.2. Other parameters not listed in this clause can be derived from the setup of each test.

A.9 Angle of Arrival (AoA) for FR2 RRM test cases

This clause specifies the AoA setups for FR2 RRM test cases in clause 5 and 7. The applicable AoA setup is defined in each test case in clause 5 and 7.

A.9.1 Setup 1: Single AoA in Rx beam peak direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, are aligned to the UE Rx beam peak direction (as defined in TS 38.101-2 [3]).

A.9.2 Setup 2: Single AoA in non Rx beam peak direction

A.9.2.1 Setup 2a: Single AoA in non Rx beam peak direction without change in direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, align to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The direction (AoA) of the signals shall not be changed between test iterations.

A.9.2.2 Setup 2b: Single AoA in non Rx beam peak direction with change in direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, align to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. For UE power class 3, the direction (AoA) of the signals shall be changed for each test iteration (for UE power classes other than 3, this is FFS). Unless otherwise specified by the test case, the TE shall alternate between a minimum of 33 different AoAs. The minimum separation between AoAs used in consecutive iterations shall be 30° in great-circle distance.

NOTE: if it is not possible to find at least 33 different test points meeting the required criteria (FFS), the test shall alternate between all the available test points.

A.9.3 Setup 3: 2 AoAs

There are 2 active probes in the test. The DL signals, and noise if applicable, transmitted from the two active probes, align to directions (AoAs) which are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The relative angular offset between the directions (AoAs) of the 2 active probes, shall be changed for each test iteration. Unless otherwise specified by the test case, the TE shall alternate between a minimum of 33 different test points. A test point comprehends the relative angular offset between the active probes, and the AoA of each of the signals from the UE point of view. The relative angular offset between the active probes shall change for consecutive test points.

The applicable set of relative angular offsets between the 2 active probes is given in Table A.9.3-1 for each UE power class.

Table A.9.3-1: Set of relative angular offsets between active probes for each power class

UE Power class	Relative angular offset between active probes
1	30°, 60°, 90° and 120°
2	FFS
3	30°, 60°, 90°, 120° and 150°
4	FFS

NOTE: if it is not possible to find at least 33 different test points meeting the required criteria (that is, the two AoAs are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] and the angular offset between them corresponds to one of the offsets in Table A.9.3-1 for the corresponding UE power class), the test shall alternate between all the available test points.

A.9.4 Setup 4: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak

A.9.4.1 Setup 4a: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak without change in direction

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. One probe is aligned to the UE Rx beam peak direction as defined in TS 38.101-2 [3]. The second is aligned to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The direction (AoA) of the non Rx beam peak signal shall not be changed between test iterations.

A.9.4.2 Setup 4b: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak with change in direction

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. One probe is aligned to the UE Rx beam peak direction as defined in TS 38.101-2 [3]. The second is aligned to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class.

For UE power class 3, the relative angular offset between the directions (AoAs) of the 2 active probes shall be changed for each test iteration, within the probe alignment described above. The applicable set of relative angular offsets between the 2 active probes is given in Table A.9.3-1 for each UE power class. Unless otherwise specified by the test case, the TE shall alternate between a minimum of 5 different test points. A test point comprehends the relative angular offset between the active probes, and the AoA of each of the signals from the UE point of view, one of them being the Rx beam peak direction. The relative angular offset between the active probes shall change for consecutive test points.

NOTE: if it is not possible to find at least 5 different test points meeting the required criteria (that is, the two AoAs are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] and the angular offset between them corresponds to one of the offsets in Table A.9.3-1 for the corresponding UE power class), the test shall alternate between all the available test points.

A.9.5 Setup 5: 2 AoAs for simultaneous reception with QCL Type-D

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. The 2 AoAs (AoA1 and AoA2) for simultaneous reception with different QCL-typeD are from the set of AoA pairs, denoted by (AoA1, AoA2) that can support 2 AoA reception for UE declared AoA angular separation and declared orientation in the positioner of the test system according to the spherical coverage requirement for simultaneous reception from multiple directions as defined in clause 7.3K.3 of TS 38.101-2 [3] for UE power class 3 supporting simultaneous reception from multiple directions. The angular separation between the directions (AoA1 and AoA2) of the 2 active probes is declared from Table 7.3K.3-1 in clause 7.3K.3 of TS 38.101-2 [3] and shall not be changed for each test iteration.

AoA1 needs to satisfy the spherical coverage requirement in Table 7.3.4.3-1 of TS 38.101-2 [3].

NOTE: The chosen AoA pair (AoA1, AoA2) is up to RAN5.

A.9.6 Setup 6: 3 AoAs for simultaneous reception with different QCL Type-D

There are 3 active probes in the test and the DL signals and noise are transmitted from the three active probes.

Out of the three AoAs, one AoA (AoA1) is aligned to a direction which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for UE power class 3 and other 2 AoAs (AoA2 and AoA3) are from the set of AoA pairs, denoted by (AoA2, AoA3) that can support 2 AoA reception for UE declared AoA angular separation and declared orientation in the positioner of the test system according to the spherical coverage requirement for simultaneous reception from multiple directions as defined in clause 7.3K.3 of TS 38.101-2 [3] for power class 3 supporting simultaneous reception from multiple directions.

The angular offset between the directions of the AoA pair (AoA2, AoA3) is declared from Table 7.3K.3-1 in clause 7.3K.3 of TS 38.101-2 [3] and shall not be changed for each test iteration.

NOTE: The chosen AoA pair (AoA2, AoA3) is up to RAN5.

A.9.7 Setup 7: 3 AoAs

There are 3 active probes in the test. The DL signals, and noise if applicable, transmitted from the three active probes, align to directions (AoAs) which are from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [3] for each UE power class. The relative angular offset between the directions (AoAs) of the 3 active probes, shall be changed for each test iteration. Any combinations of two relative angular offsets between 2 active probes specified in Table A.9.3-1, is considered as a valid applicable relative angular offsets between 3 active probes for the respective power class.

A.10 TCI State Configuration

A.10.1 Introduction

This clause provides the configurations for TCI states towards either SSB or CSI-RS. The TCI states defined in this clause are configured in each test when applicable to indicate that certain DL signals are quasi-collocated with the referenceSignal configured in the TCI states.

A.10.2 TCI states

NOTE 2: referenceSignal configurations towards which the TCI states are configured are defined in a test-specific manner.
NOTE 3: Reference TRS resource sets are defined in A.1.4A, and the applicable TRS resource set(s) are specified in each test case. When a single TRS resource set is configured in a test case, it is considered as resource set 1.

A.10A Unified TCI State Configuration

A.10A.1 Introduction

This clause provides the configurations for unified TCI states towards either SSB or CSI-RS. The DLorJoint TCI states defined in this clause are configured in each test when applicable to indicate that certain DL (and UL, if joint DL/UL

operation is configured) signals are QCL'ed with the referenceSignal configured in the TCI states. The UL TCI states defined in this clause are configured in each test when applicable to indicate that certain UL signals are QCL'ed with the referenceSignal configured in the TCI states.

A.10B LTM Candidate TCI State Configuration

A.10B.1 Introduction

This clause provides the configurations for TCI states of LTM candidate cell(s) towards either SSB or TRS. The LTM candidate DLorJoint TCI states defined in this clause are configured in each test when applicable to indicate that certain DL (and UL, if joint DL/UL operation is configured) signals are QCL'ed with the referenceSignal configured in the TCI states. The UL TCI states defined in this clause are configured in each test when applicable to indicate that certain UL signals are QCL'ed with the referenceSignal configured in the TCI states.

A.19 Test Cases involving E-UTRA/FR1 and FR2 carriers

A.19.1 Introduction

The following applies to UE when undergoing tests with a mix of E-UTRA/NR FR1 and NR FR2 carriers in clauses 5, 7 and 8.

A.19.2 Principle of Testing in EN-DC

For test cases in clause 5 listed in Table A.19.2-1, the following applies:

- UE does not have to pass the test case.

Table A.19.2-1: Test cases with the E-UTRA/FR1 – FR2 testability issue (EN-DC)

Annex B (normative): Conditions for RRM requirements applicability for operating bands

B.1 Conditions for NR RRC_IDLE state mobility

B.1.1 Introduction

In Annex B.1, the following conditions are specified:

- UE conditions which shall apply for UE intra-frequency idle state mobility test cases in clauses 6.1 and 7.1,
- UE conditions which shall apply for UE inter-frequency idle state mobility test cases in clauses 6.1 and 7.1.
- UE conditions which shall apply for RedCap UE intra-frequency idle state mobility test cases in clauses 16.1 and 17.1.
- UE conditions which shall apply for RedCap UE inter-frequency idle state mobility test cases in clauses 16.1 and 17.1.

B.1.2 Conditions for measurements on NR intra-frequency cells for cell re-selection

Editor's notes for Table B.1.2-2 (RAN4 dependant):

- The value of Y for power class 4 is FFS, where Y_4 is the rough/fine beam gain difference in Rx beam peak direction for power class 4
- The value of Z for power class 4 is FFS, where Z_4 is the rough/fine beam gain difference in spherical coverage directions for power class 4

This clause defines the following conditions for NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.1.2-1 for FR1 NR cells.

The conditions are defined in Table B.1.2-2 for FR2 NR cells.

NOTE 2: Values specified at the Reference point to give minimum SSB Ês/Iot, with no applied noise.
NOTE 3: For UEs that support multiple FR2 bands, Rx Beam Peak values are increased by $\Delta MB_{P,n}$ and Spherical coverage values are increased by $\Delta MB_{S,n}$, the UE multi-band relaxation factor in dB specified in clause 6.2.1 of TS 38.101-2 [3].

B.1.3 Conditions for measurements on NR inter-frequency cells for cell re-selection

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions defined in Table B.1.2-1 for FR1 NR intra-frequency cell re-selection shall also apply for FR1 NR inter-frequency cells in this clause.

The conditions defined in Table B.1.2-2 for FR2 NR intra-frequency cell re-selection shall also apply for FR2 NR inter-frequency cells in this clause.

B.1.4 Conditions for measurements on NR intra-frequency cells for cell re-selection for RedCap

This clause defines the following conditions for RedCap NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.1.4-1 and Table B.1.4-2 for 1 Rx and 2 Rx RedCap respectively for FR1 NR cells.

The conditions are defined in Table B.1.4-3 for FR2 NR cells.

- The value of Z for power class 4 is FFS, where Z4 is the rough/fine beam gain difference in spherical coverage directions for power class 4

B.1.5 Conditions for measurements on NR inter-frequency cells for cell re-selection for RedCap

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions defined in Table B.1.4-1 and Table B.1.4-2 for 1 Rx and 2 Rx RedCap respectively for FR1 RedCap NR intra-frequency cell re-selection shall also apply for FR1 RedCap NR inter-frequency cells in this clause.

The conditions defined in Table B.1.4-3 for FR2 RedCap NR intra-frequency cell re-selection shall also apply for FR2 RedCap NR inter-frequency cells in this clause.

B.1.6 Conditions for measurements on NR intra-frequency cells for cell re-selection for satellite access

This clause defines the following conditions for NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band for satellite access.

The conditions are defined in Table B.1.6-1 for FR1 NR cells.

Table B.1.6-1: Conditions for intra-frequency cell re-selection in FR1 for satellite access

NOTE 1: NR operating band groups for satellite access are defined in clause 3A.4.1A.				

B.1.7 Conditions for measurements on NR inter-frequency cells for cell re-selection for satellite access

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band for satellite access.

The conditions defined in Table B.1.6-1 for FR1 NR intra-frequency cell re-selection for satellite access shall also apply for FR1 NR inter-frequency cells for satellite access in this clause.

B.1.8 Conditions for measurements on NR intra-frequency cells for cell re-selection under CCA

This clause defines the following conditions for NR intra-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.1.8-1 for FR1 NR cells under CCA.

NOTE 1: NR operating band groups are as defined in clause 3A.4.1.				

B.1.9 Conditions for measurements on NR inter-frequency cells for cell re-selection under CCA

This clause defines the following conditions for NR inter-frequency measurements performed based on SSBs for cell re-selection: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions defined in Table B.1.8-1 for FR1 NR intra-frequency cells under CCA shall also apply to FR1 NR inter-frequency cells under CCA in this clause.

B.2 Conditions for NR RRC_CONNECTED state

B.2.1 Introduction

In Annex B.2, the following conditions are specified:

- UE conditions which shall apply for UE intra-frequency measurement procedures and measurement performance tests in clauses 4.6, 4.7, 5.6, 5.7, 6.6, 6.7, 7.6 and 7.7,

  UE conditions which shall apply for UE inter-frequency measurements procedures and requirements in Clause 9,

- UE conditions which shall apply for UE intra-frequency measurements performance requirements in Clause 10,

- UE conditions which shall apply for UE inter-frequency measurements performance requirements in Clause 10.

B.2.2 Conditions for NR intra-frequency measurements

Editor's notes for Table B.2.2-2 (RAN4 dependant):

- The value of Y for power class 4 is FFS, where Y_4 is the rough/fine beam gain difference in Rx beam peak direction for power class 4

- The value of Z for power class 4 is FFS, where Z_4 is the rough/fine beam gain difference in spherical coverage directions for power class 4

This clause defines the following conditions for NR intra-frequency measurements and corresponding procedures performed based on SSBs: SSB_RP and SSB Ês/Iot, applicable for a corresponding operating band.

The conditions are defined in Table B.2.2-1 for FR1 NR cells.

The conditions are defined in Table B.2.2-2 for FR2 NR cells.

B.3 RRM requirement exceptions

B.3.1 Introduction

Annex B.3 covers exceptions for the side conditions based on receiver sensitivity for CA, DC, and SUL.

B.3.2 Receiver sensitivity relaxation for CA

B.3.2.1 Receiver sensitivity relaxation for UE supporting CA in FR1

For a UE supporting inter-band carrier aggregation configuration with uplink in NR band, if there is a relaxation of receiver sensitivity $\Delta R_{IB,c}$>0 dB as defined in TS 38.101-1 [18, Clause 7.3A.3], the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB,c}$ defined for the corresponding downlink NR bands.

For a UE supporting CA configuration in FR1, the requirement in this clause applies for both SC and CA operation.

B.3.2.2 Receiver sensitivity relaxation for UE configured with CA in FR1

B.3.2.2.1 Inter-band carrier aggregation

For a UE configured with inter-band carrier aggregation with active uplink in NR band, if there is a relaxation of receiver sensitivity $\Delta R_{IB,c}$>0 dB as defined in TS 38.101-1, Clause 7.3A.3 [2], the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB,c}$ defined for the corresponding downlink NR bands.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.2.1 should not be applied.

B.3.2.2.2 Reference sensitivity exceptions due to UL harmonic interference for CA

In this clause, requirements exceptions are described for the UE configured with a band in FR1 when it is impacted by UL harmonic interference from another band in FR1 of the same CA configuration.

A relevant side condition (SSB_RP and Io) in a requirement shall be increased by the amount Δ=L2-L1, where L1 is the reference sensitivity level specified in TS 38.101-1 [2], Clause 7.3.2, and L2 is the reference sensitivity level based on the requirements in TS 38.101-1 [2], Clause 7.3A.4, when the following conditions are fulfilled,

- corresponding downlink component carriers on different NR bands are configured with CA and active,
- the uplink is configured in the NR low operating band and is active,
- the uplink configuration is as specified in TS 38.101-1 [2], Clause 7.3A.4, and
- the exception requirements specified in TS 38.101-1 [2], Clause 7.3A.4 apply.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.2.1 should not be applied.

B.3.2.2.3 Reference sensitivity exceptions due to intermodulation interference due to 2UL CA

In this clause, requirements exceptions are described for the UE with an inter-band carrier aggregation with uplink assigned to two NR bands.

A relevant side condition (SSB_RP and Io) in a requirement shall be increased by the amount Δ=L2-L1, where L1 is the reference sensitivity level specified in TS 38.101-1 [2], Clause 7.3.2, and L2 is the reference sensitivity level based on the requirements in TS 38.101-1 [2], Clause 7.3A.5, when the following conditions are fulfilled,

- corresponding downlink component carriers on different bands are configured with CA and active,
- uplinks are assigned to two NR bands,
- the exception requirements specified in TS 38.101-1 [2], Clause 7.3A.5 apply.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.2.1 should not be applied.

B.3.2.3 Receiver sensitivity relaxation for UE supporting CA in FR2

Editor's note: TBD

B.3.2.4 Receiver sensitivity relaxation for UE configured with CA in FR2

B.3.2.4.1 Intra-band contiguous carrier aggregation

For a UE configured with intra-band contiguous carrier aggregation in NR band in FR2, if there is a relaxation of receiver sensitivity ΔR_{IB}>0 dB as defined in TS 38.101-2 [3], Clause 7.3A.2.1 depending on the aggregated channel bandwidth, the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB}$ defined for the corresponding downlink NR bands.

B.3.2.4.2 Intra-band non-contiguous carrier aggregation

For a UE configured with intra-band non-contiguous carrier aggregation in NR band in FR2, if there is a relaxation of receiver sensitivity ΔR_{IB}>0 dB as defined in TS 38.101-2 [3], Clause 7.3A.2.1 depending on the aggregated channel bandwidth, the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB}$ defined for the corresponding downlink NR bands.

B.3.3 Receiver sensitivity relaxation for DC

Editor's note: TBD

B.3.4 Receiver sensitivity relaxation for SUL

B.3.4.1 Receiver sensitivity relaxation for UE supporting SUL in FR1

For a UE supporting a SUL configuration in FR1, if there is a relaxation of receiver sensitivity $\Delta R_{IB,c}$>0 dB as defined in TS 38.101-1 [2], Clause 7.3C.3, the relevant side conditions specifying received power levels (SSB_RP and Io) shall be increased by the amount $\Delta=\Delta R_{IB,c}$ defined for the corresponding downlink NR bands.

For a UE supporting a SUL configuration in FR1, the requirement in this clause applies for both SC and SUL operation.

B.3.4.2 Receiver sensitivity relaxation for UE configured with SUL in FR1

B.3.4.2.1 Reference sensitivity exceptions due to UL harmonic interference for SUL

In this clause, requirements exceptions are described for the UE with a band in FR1 when it is impacted by UL harmonic interference from another band in FR1 of the same SUL configuration.

A relevant side condition (SSB_RP and Io) in a requirement shall be increased by the amount Δ=L2-L1, where L1 is the reference sensitivity level specified in TS 38.101-1 [2], Clause 7.3.2, and L2 is the reference sensitivity level based on the requirements in TS 38.101-1 [2], Clause 7.3C.2, when the following conditions are fulfilled,

- a downlink component carrier is configured in NR band and is active,
- the uplink is configured in the NR low operating band and is active,
- the uplink configuration is as specified in TS 38.101-1 [2], Clause 7.3C.2, and
- the exception requirements specified in TS 38.101-1 [2], Clause 7.3C.2 apply.

If the relaxation Δ specified in this clause applies, then the relaxation specified in Clause B.3.4.1 should not be applied.

B.4 Conditions for NR sidelink

B.4.1 Test parameters for GNSS signals

This clause defines the reference signal power levels of generated satellites for a corresponding GNSS, which will be used in NR sidelink and satellite access test cases.

Table B.4.1-1: GNSS Reference Signal Power Parameters

System	Parameters	Unit	Value
	Number of generated satellites per system	-	6
GPS[Note 1]	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
BDS	Reference signal power level for all satellites	dBm	-133
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on UE capabilities. NOTE 2: The DUT UE does not need to support all systems. The DUT UE shall support at least one system and will be test for the supported systems.			

B.4.2 Conditions for PSBCH-RSRP Accuracy Requirements

This clause defines the following conditions for PSBCH-RSRP measurement accuracy requirements applicable for a corresponding operating band.

The conditions are defined in Table B.4.2-1 for FR1.

Table B.4.2-1: Conditions for PSBCH-RSRP measurements in FR1

Parameter	NR sidelink operating band groups [Note1]	Minimum S-SSB_RP			S-SSB Ês/Iot
		dBm/$SCS_{S\text{-}SSB}$			dB

	NR_TDD_FR1_J	-122.5	-119.5	-116.5	
NOTE 1: NR sidelink operating band groups are as defined in Section 3A.4 for the corresponding NR operating bands.					

B.4.3 Conditions for Selection/Reselection to Intra-frequency SyncRef UE

This clause defines the S-SSB_RP and S-SSB Ês/Iot applicable for a corresponding operating band.

The conditions for selection/reselection to intra-frequency SyncRef UE are defined in Table B.4.3-1 for FR1.

Table B.4.3-1: NR sidelink synchronization measurements in FR1

B.4.4 Conditions for L1 SL-RSRP Accuracy Requirements

This clause defines the following conditions for L1 SL-RSRP measurement accuracy requirements applicable for a corresponding operating band.

The conditions are defined in Table B.4.4-1 for FR1.

Table B.4.4-1: Conditions for L1 SL-RSRP measurements in FR1

NOTE 1: NR sidelink operating band groups are as defined in Section 3A.4 for the corresponding NR operating bands. NOTE 2: The parameter Ês/Iot is the Ês/Iot of PSCCH-DMRS and/or PSSCH-DMRS. NOTE 3: The SCS is for PSCCH and/or PSSCH.					

B.5 High level test procedure for SAN RRM tests

The following high-level steps are conducted for test cases for SAN defined in clause 14.

- A set of ephemeris information are pre-defined for each satellite corresponding to different epoch times in TS 38.508-1 [14].
- The same ephemeris information will be maintained during the test (constant ephemerisInfo in all SIB19 updates) i.e., SAN RRM test cases are defined with fixed constant Delay and Doppler shift from satellite access node to UE unless otherwise stated.
- The range from which the selected constant Delay is selected is as follows:
  - For GSO an altitude of 35,786km is considered. The range of the one-way delay between UE and satellite is from 119.375ms to 128.79ms.
  - For NGSO an altitude of 600km and 1200km on a circular orbit are considered. The range of the one-way delay between UE and satellite is from 2ms (lowest value for LEO orbit 600km) to 6.67ms (highest value for LEO orbit 1200km).
- The constant Doppler shift (i.e. frequency offset) is derived from the same ephemeris (i.e., orbit emulation) as the Delay.
- UE location is determined for the test. The ephemeris and the UE location should be designed such that elevation angle relative to the UE position shall not be smaller than 30° during entire test time.
- Test equipment adjusts the time and frequency of transmission according to pre-defined ephemeris (constant in all SIB19 updates) and UE location.

Annex C (normative): Downlink physical channels and propagation conditions

C.1 Downlink physical channels

C.1.1 General

The following clauses describe the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

C.1.2 Default downlink signal levels

The downlink power settings in Table C.1.2-1 and Table C.1.2-2 are used unless otherwise specified in a test case for FR1 cell and FR2 cell, respectively. The downlink power settings in Table C.1.2-1 and Table C.1.2-2 are also used for the initial registration for NR /5GC test cases in clauses 6 and 7. For EN-DC test cases in clauses 4 and 5, the E-UTRA power settings used for initial registration are defined in Annex A.6.

For FR1, if the UE has more than one Rx antenna, the downlink signal is applied to each one. All UE Rx antennas shall be connected.

Table C.1.2-1: Default Downlink power levels for NR (FR1)

NOTE 1: The channel bandwidth powers are informative, based on -85dBm/15kHz SS/PBCH SSS EPRE, then scaled according to the number of RBs and rounded to the nearest integer dBm value. Full RE allocation with no boost or deboost is assumed.
NOTE 2: The power level is specified at each UE Rx antenna.
NOTE 3: DL level is applied for any of the Subcarrier Spacing configuration ( ) with the same power spectrum density of -85dBm/15kHz.

Table C.1.2-2: Default Downlink power levels for NR (FR2)

NOTE 1: The channel bandwidth powers are informative, based on -99dBm/60kHz SS/PBCH SSS EPRE, then scaled according to the number of RBs and rounded to the nearest integer dBm value. Full RE allocation with no boost or deboost is assumed. NOTE 2: The power level is specified at the centre of quiet zone. NOTE 3: DL level is applied for any of the Subcarrier Spacing configuration (μ) with the same power spectrum density of –99dBm/60kHz.						

The default signal level uncertainty for FR1 is +/-3dB at each test port, for any level specified. The default signal level uncertainty for FR2 is +/-6dB at centre of quiet zone, for any level specified. If the uncertainty value is critical for the Test purpose, a tighter uncertainty is specified for the related test case in Annex F

C.1.3 Default connection setup

Table C.1.3-1 describes the downlink physical channels that are required for NR connection setup. For EN-DC test cases in clauses 4 and 5, the required E-UTRA downlink physical channels are defined in TS 36.521-3 [26] Annex C.2.

C.2 Propagation conditions

C.2.0 General

The propagation conditions and channel models for various environments are specified. For each environment a propagation model is used to evaluate the propagation pathless due to the distance. Channel models are formed by combining delay profiles with a Doppler spectrum, with the addition of correlation properties in the case of a multi-antenna scenario.

C.2.1 No interference

The downlink connection between the SS and the UE is without AWGN, and has no fading or multipath effects.

C.2.2 Static propagation conditions

C.2.2.0 General

The downlink connection between the SS and the UE is an AWGN environment (unless otherwise stated) with no fading or multipath effects.

C.2.2.1 UE receiver with 2Rx antenna connectors

For 1 port transmission to UE receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}.$$

For 2 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{pmatrix} 1 & j \\ 1 & -j \end{pmatrix}$$

For 4 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & j & j \\ 1 & 1 & -j & -j \end{bmatrix}$$

C.2.2.2 UE receiver with 4Rx antenna connectors

For 1 port transmission to UE receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}.$$

For 2 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & j \\ 1 & -j \\ 1 & j \\ 1 & -j \end{bmatrix}.$$

For 4 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & j & j \\ 1 & 1 & -j & -j \\ 1 & -1 & j & -j \\ 1 & -1 & -j & j \end{bmatrix}.$$

C.2.3 Multi-path fading propagation conditions

Same as defined in TS 38.521-4 [20] clause B.2.

Annex D (normative): Deviations from standard test configuration

D.1 Test cases with different numerologies

TBD

D.2 EN-DC test cases with different EN-DC configurations

D.2.0 General

In clauses 4 and 5, EN-DC test cases may be defined for two component carriers (CCs) as well as for more than two CCs to verify the same RRM requirement.

D.2.1 Principle of testing

If multiple EN-DC test cases are defined for two CCs as well as for more than two CCs to verify the same type of RRM requirement, and this requirement is dependent on the number of CCs, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the EN-DC test cases with the maximum number of CCs in EN-DC supported by the UE. Otherwise if the same type of RRM requirement is independent of the number of CCs then from the UE performance point of view the test coverage can be considered fulfilled by executing only the EN-DC test cases with two CCs in EN-DC supported by the UE.

Editor's Note: The maximum number of CCs that can be used in FR2 tests in EN-DC would depend on the test equipment capability.

D.3 Carrier aggregation test cases with different CA configurations

D.3.0 General

In clauses 6 and 7, carrier aggregation test cases may be defined for two CCs as well as for more than two CCs to verify the same RRM requirement.

D.3.1 Principle of testing

If multiple carrier aggregation test cases are defined for two CCs as well as for more than two CCs to verify the same RRM requirement, and the test requirement is dependent on the number of CCs, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the CA test cases with the maximum number of CCs in CA supported by the UE. Otherwise if the same type of RRM requirement is independent of the number of CCs then from the UE performance point of view the test coverage can be considered fulfilled by executing only the CA test cases with at least two CCs in CA supported by the UE.

Editor's Note: The maximum number of CCs that can be used in FR2 tests in CA would depend on the test equipment capability.

D.4 Antenna connection for 4Rx capable UEs

D.4.0 General

All the tests in this test specification are defined for UEs supporting 2Rx. This clause explains how to apply the 2Rx tests in clauses 4 and 6 to UEs supporting 4Rx antenna ports. No tests are currently specified in clauses 4 or 6 which are

applicable only to 4Rx antenna ports, so 4Rx capable UEs are always tested by reusing tests which were originally specified for 2Rx UEs. Please notice that 4Rx is in general not supported for the test cases in clauses 5 and 7.

D.4.1 Principle of testing

D.4.1.1 Single carrier tests

For 4Rx capable UEs supporting at least one band where 2Rx is supported and 4Rx is not supported, all single carrier tests specified in clauses 4 and 6, except 4.7 and 6.7 shall be tested with 2Rx on any band where 2Rx is supported and 4Rx is not supported, with the antenna connection defined in D.4.2.1. Single carrier tests specified clauses 4.7 and 6.7 are band dependent and shall be tested in all bands supported by the UE, using 2Rx and the antenna connection defined in D.4.2.1 for the bands where 2Rx is supported and 4Rx is not supported, and the antenna connection defined in D.4.2.2 for the bands where 2Rx is not supported.

For 4Rx capable UEs that do not support any band where 2Rx is supported and 4Rx is not supported, all single carrier tests in clauses 4 and 6 shall be tested with 4Rx using the antenna configuration defined in D.4.2.2.For radio link monitoring tests, the SNR levels are modified according to table D.4.1.1-1 and table D.4.1.1-2

D.4.1.2 Carrier aggregation tests

For carrier aggregation tests, the antenna connection is selected independently for each cell, the PCell and the SCell(s). If a cell (either PCell or any of the SCell(s)) is on a band where 2Rx is supported and 4Rx is not supported, antenna connection in Clause D.4.2.1 shall be used for this cell. If the cell is on a band where 2Rx is not supported, antenna connection in clause D.4.2.2 shall be used for this cell.

D.4.1.3 EN-DC tests

For all EN-DC tests, the antenna connection is selected independently for each cell. For the E-UTRA PCell, the antenna connection specified in D.4.2.3 shall be used if the PCell is on an E-UTRA band where 2Rx is supported and 4Rx is not supported, and the antenna connection specified in D.4.2.4 shall be used if the PCell is on an E-UTRA band not supporting 2Rx.

For the NR PSCell and SCell(s), the principle of testing is the same as in D.4.1.2.

D.4.2 Antenna connection

D.4.2.1 Antenna connection for NR bands where 2Rx is supported

For NR bands where 2Rx is supported and 4Rx is not supported, the UE shall decide via manufacturer declaration and antenna port configuration which 2 of the 4 antenna ports shall be connected with the downlink signal from the SS. The remaining 2 antenna ports shall be connected to zero input. The parameters and test requirements remain unmodified.

D.4.2.2 Antenna connection for NR bands where only 4Rx is supported

For NR bands where only 4Rx is supported, all 4Rx antenna ports shall be connected to the downlink signal from the SS. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring tests specified in D.4.1.1 and D.4.1.2, the parameters and test requirements remain unmodified.

D.4.2.3 Antenna connection for E-UTRA bands where 2Rx is supported

For E-UTRAN bands where 2Rx is supported and 4Rx is not supported, the UE shall decide via manufacturer declaration and antenna port configuration which 2 of the 4 antenna ports shall be connected with the downlink signal from the SS. The remaining 2Rx antenna ports shall be connected to zero input. The parameters and test requirements remain unmodified.

D.4.2.4 Antenna connection for E-UTRA bands where only 4Rx is supported

For E-UTRAN bands where only 4Rx is supported, all 4Rx antenna ports shall be connected to the downlink signal from the SS. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring tests specified in TS 36.521-1 [26] clause 3A.4.1.2.1 and 3A.4.1.2.2, the parameters and test requirements remain unmodified.

D.4A Antenna configurations with unlicensed bands for 4Rx capable UEs

D.4A.1 Introduction

All tests in clauses 10, 11, 12 and 13 are specified for UEs supporting 2RX. In this clause, the antenna connection method for applying 2RX tests to UEs supporting 4RX antenna ports is specified. No tests are currently specified in clauses 10, 11, 12 or 13 which are applicable only to 4RX antenna ports, so 4RX capable UEs are always tested by reusing tests which were originally specified for 2RX UEs.

D.4A.2 Principle of Testing

D.4A.2.1 Single Carrier Tests

For 4RX capable UEs supporting at least one 2RX band, the, all single carrier tests specified in clauses 10, 11, 12 and 13 except those in 10.5, 11.6, 12.5 and 13.4, shall be tested on any band where 2RX is supported with the antenna connection specified in D.4A.2.4. For single carrier tests specified in clauses 10.5, 11.6, 12.5 or 13.4, all tests shall be tested with the antenna connection specified in D.4A.2.4 for bands where 2RX is supported, and the antenna connection specified in D.4A.2.5 for bands where 4RX is supported.

For 4RX capable UEs which do not support any 2RX band, all tests specified in clauses 10, 11, 12 and 13 shall be tested using the antenna connection specified in clause D.4A.2.5. For radio link monitoring tests, the SNR levels are modified according to table D.4A.2.1-1 and table D.4A.2.1-2.

D.4A.2.2 Carrier Aggregation Tests

All carrier aggregation tests are performed using the antenna connection in clause D.4A.2.4 for the PCell antenna connection if the PCell is on a band where 2RX is supported or the antenna connection in D.4A.2.5 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All carrier aggregation tests are performed using the antenna connection in clause D.4A.2.4 for the SCell antenna connection if an SCell is on band where 2RX is supported or the testing procedure in D.4A.2.5 for the SCell antenna connection if an SCell is on a band where 4RX is supported.

D.4A.2.3 EN-DC Tests

All EN-DC tests are performed using the antenna connection in clause D.4A.2.6 for the PCell antenna connection if the PCell is on a band where 2RX is supported or the antenna connection in D.4A.2.7 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All EN-DC tests are performed using the antenna connection in clause D.4A.2.4 for the PSCell or SCell antenna connection if an SCell is on band where 2RX is supported or the testing procedure in D.4A.2.5 for the SCell antenna connection if an SCell or PSCell is on a band where 4RX is supported.

D.4A.2.4 Antenna connection for bands where 2RX is supported

For bands where 2RX is supported, it is left to the UE declaration and AP configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 Rx ports shall be connected with zero input**.** No test parameters or requirements are modified.

D.4A.2.5 Antenna connection for bands where 4RX is supported

For bands where 4RX is supported, all 4 RX antennas are connected with data source from system simulator**.** The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clauses D.4A.2.1 and D.4A.2.2, no test parameters or requirements are modified.

D.4A.2.6 EN-DC LTE Antenna connection for bands where 2RX is supported

For bands where LTE 2RX is supported, it is left to the UE declaration and AP configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 Rx ports shall be connected with zero input**.** No test parameters or requirements are modified.

D.4A.2.7 EN-DC LTE Antenna connection for bands where 4RX is supported

For bands where LTE 4RX is supported, all 4 RX antennas are connected with data source from system simulator**.** The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clauses A.3.8.1.2.1 and A.3.8.1.2.2 of TS 36.133 [23], no test parameters or requirements are modified.

D.4B Antenna connection for 8Rx capable UEs

D.4B.1 Introduction

All tests in clause 4 and 6 are specified for UEs supporting 2Rx. In this clause, the antenna connection method for applying 2Rx tests or 4Rx tests to UEs supporting 8Rx antenna ports is specified. No tests are currently specified in clause 4 or 6 which are applicable only to 8Rx antenna ports, so 8Rx capable UEs are always tested by reusing tests which were originally specified for 2Rx UEs or 4Rx UEs.

D.4B.1 Principle of testing

D.4B.1.1 Single carrier tests

For 8Rx capable UEs supporting at least one band where 2Rx is supported and either 4Rx or 8Rx is not supported, all single carrier tests specified in clause 4 and 6 except those in clause 4.7 and 6.7 shall be tested on any band where 2Rx is supported and 8Rx is not supported with the antenna connection specified in clause D.4B.2.1. For single carrier tests specified in clause 4.7 or 6.7, all tests shall be tested with the antenna connection specified in clause D.4B.2.1 for bands where 2Rx is supported and 8Rx is not supported, and the antenna connection specified in clause D.4B.2.3 for bands where 8Rx is supported.

For 8Rx capable UEs supporting at least one band where 4Rx is supported and 8Rx is not supported but without supporting any band where only 2Rx is supported, all single carrier tests specified in clause 4 and 6 except those in clause 4.7 and 6.7 shall be tested on any band where 4Rx is supported and 8Rx is not supported with the antenna connection specified in clause D.4B.2.2. For single carrier tests specified in clause 4.7 or 6.7, all tests shall be tested with the antenna connection specified in clause D.4B.2.2 for bands where 4Rx is supported and 8Rx is not supported, and the antenna connection specified in D.4B.2.3 for bands where 8Rx is supported. For radio link monitoring tests, the SNR levels are modified according to Table D.4.1.1-1 and Table D.4.1.1-2. For beam failure detection and link recovery tests, the SNR levels are modified according to Table D.4.1.1-3.

For 8Rx capable UEs which do not support any band where 8Rx is not supported, all tests specified in clauses A.4 and A.6 shall be tested using the antenna connection specified in clause D.4B.2.3. For radio link monitoring tests, the SNR levels are modified according to Table D.4.1.1-1 and Table D.4.1.1-2. For beam failure detection and link recovery tests, the SNR levels are modified according to Table D.4.1.1-3.

D.4B.1.2 Carrier aggregation tests

All carrier aggregation tests are performed using the antenna connection in clause D.4B.2.1 for the PCell antenna connection if the PCell is on a band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using the antenna connection in clause D.4B.2.2 for the PCell antenna connection if the PCell is on a band where 4Rx is supported and 8Rx is not supported, or using the antenna connection in D.4B.2.3 for the PCell antenna connection if the PCell is on a band where 8Rx is supported.

All carrier aggregation tests are performed using the antenna connection in clause D.4B.2.1 for the SCell antenna connection if an SCell is on band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using the antenna connection in clause D.4B.2.2 for the SCell antenna connection if an SCell is on a band where 4Rx is supported and 8Rx is not supported, or using the antenna connection in clause D.4B.2.3 for the SCell antenna connection if an SCell is on a band where 8Rx is supported.

D.4B.1.3 EN-DC tests

All EN-DC tests are performed using the antenna connection in clause D.4B.2.4 for the PCell antenna connection if the PCell is on a band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using the antenna connection in clause D.4B.2.5 for the PCell antenna connection if the PCell is on a band where 4Rx is supported and 8Rx is not supported, or using the antenna connection in clause D.4B.2.6 for the PCell antenna connection if the PCell is on a band where 8Rx is supported.

All EN-DC tests are performed using the antenna connection in clause D.4B.2.1 for the PSCell or SCell antenna connection if an SCell or PSCell is on band where 2Rx is supported and either 4Rx or 8Rx is not supported, or using antenna connection in clause D.4B.2.2 for the PSCell or SCell antenna connection if an SCell or PSCell is on a band where 4Rx is supported and 8Rx is not supported, or using antenna connection in D.4B.2.3 for the PSCell or SCell antenna connection if an SCell or PSCell is on a band where 8Rx is supported.

D.4B.2 Antenna connection

D.4B.2.1 Antenna connection for NR bands where 2Rx is supported

For bands where 2Rx is supported and either 4Rx or 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 2 of the 8 Rx ports are connected with data source from system simulator. The remaining 6 Rx ports shall be connected with zero input**.** No test parameters or requirements are modified.

D.4B.2.2 Antenna connection for NR bands where 4Rx is supported

For bands where 4Rx is supported and 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 4 of the 8 Rx ports are connected with data source from system simulator. The remaining 4 Rx ports shall be connected with zero input. Except for the modifications to radio link monitoring thresholds and beam failure detection thresholds described in clause D.4A.2.1, no test parameters or requirements are modified.

D.4B.2.3 Antenna connection for bands where 8Rx is supported

For bands where 8Rx is supported, all 8 Rx antennas are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clause D.4A.2.1, no test parameters or requirements are modified.

D.4B.2.4 Antenna connection for E-UTRA bands where 2Rx is supported

For E-UTRAN bands where 2Rx is supported and 4Rx or 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 2 of the 8 Rx ports are connected with data source from system simulator. The remaining 6 Rx ports shall be connected with zero input. No test parameters or requirements are modified.

D.4B.2.5 Antenna connection for E-UTRA bands where 4Rx is supported

For bands E-UTRAN where 4Rx is supported and 8Rx is not supported, it is left to the UE declaration and antenna port configuration to decide which 4 of the 8 Rx ports are connected with data source from system simulator. The remaining 4 Rx ports shall be connected with zero input. Except for the modifications to radio link monitoring thresholds described in TS 36.133 [23] clause A.3.8.1.2.1 and A.3.8.1.2.2, no test parameters or requirements are modified.

D.4B.2.6 Antenna connection for E-UTRA bands where 8Rx is supported

For bands E-UTRAN where 8Rx is supported, all 8 Rx antennas are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in TS 36.133 [23] clause A.3.8.1.2.1 and A.3.8.1.2.2, no test parameters or requirements are modified.

D.5 Test Cases with Different Channel Bandwidths

D.5.1 Test Cases with Different E-UTRA Channel Bandwidths

D.5.1.1 Introduction

Test cases involving E-UTRA cell(s) may be defined with different E-UTRA channel bandwidths to verify the same type of RRM requirement.

D.5.1.2 Principle of testing

If multiple test cases involving E-UTRA cell(s) are defined with different E-UTRA channel bandwidths to verify the same type of RRM requirement that is E-UTRA channel bandwidth independent, then the UE needs to be tested with only one channel bandwidth in each E-UTRA cell and with the same bandwidth in all the E-UTRA cells used in the test case.

D.6 Test Cases for Synchronous and Asynchronous DC Operations

D.6.1 EN-DC Test Cases for Synchronous and Asynchronous EN-DC Operations

D.6.1.1 Introduction

This clause defines a principle, which is applicable to test cases verifying RRM requirements for EN-DC operation in synchronous and asynchronous scenarios.

Test cases may be defined in both synchronous EN-DC and asynchronous EN-DC scenarios to verify the same type of RRM requirement.

D.6.1.2 Principle of Testing

If EN-DC test cases are defined in both synchronous and asynchronous EN-DC scenarios to verify the same type of RRM requirement then the UE capable of both synchronous and asynchronous EN-DC operations needs to be tested with one of the tests in either synchronous or asynchronous EN-DC scenarios.

D.7 CCA model

D.7.1 Introduction

The CCA model is used in some RRM test cases with at least one cell on a carrier frequency with CCA. The intention with the CCA model is to emulate in the test equipment the behaviour of a gNB or UE which performs channel measurement to check that the channel is clear prior to performing one or more downlink or uplink transmissions.

D.7.2 CCA model for operation on a carrier frequency with CCA in FR1

D.7.2.1 DL CCA model

The same DL CCA model is applicable regardless of whether DRX cycle is used or not with the following differences:

- The counter, $l_{CCA,}$ is used to monitor the number of unavailable DBT samples withing an evaluation window, $W_{CCA_DL.}$ DBT samples outside of the evaluation window W_{CCA_DL} are discarded.
- If DRX cycle is not used then prior to each DBT window, the test equipment shall determine whether the DL CCA attempt is successful (i.e., the corresponding signals have to be transmitted), based on probability P_{CCA_DL} of successful DL CCA configured in the corresponding test case. If DRX cycle is not used, then the DL CCA model shall increment the counter l_{CCA} for every unavailable DBT sample due to DL CCA failure.
- If DRX cycle is used, then the DL CCA model shall increment the counter, l_{CCA}, once per DRX cycle for a DRX cycle if the first DBT sample in that DRX cycle is unavailable due to DL CCA failure. DL CCA failures in a DRX cycle are determined as follows:
- The test system *in the first DBT window of each DRX cycle* determines whether the DL CCA attempt is successful or not using the principle as follows:
  - If the DL CCA is successful then the test system shall transmit in all DBT windows within that DRX cycle.
  - If the DL CCA is not successful then the test system shall not transmit in any of the DBT windows within that DRX cycle. In this case l_{CCA} is increased by 1.
- The parameters, L_{CCA_DL}, L_{CCA_UL}, W_{CCA_DL} and W_{CCA_UL} can be used as in non-DRX tests.

If the CCA attempt is successful for a transmission, then the test equipment shall transmit also other remaining transmissions, according to the configuration, within the same DBT window.

If the CCA attempt is not successful for a transmission within the DBT window, the test equipment shall determine whether the CCA attempt is successful for the next configured transmission, based on probability P_{CCA_DL}.

The probability can be different in different time intervals T_i during a test case. One probability value (per cell) applies at any time point during a test; one or more probability values can be configured in the entire test, one value P_{CCA_DL} per time interval T_i where $i \geq 1$, and the multiple time intervals (when $i>1$) do not overlap (e.g., $P_{CCA_DL}=1.0$ in T_1 and $P_{CCA_DL}=0.75$ in T_2).

For semi-static channel access configuration, a single value P_{CCA_DL} is used to configure the probability of CCA success in different time intervals T_i during a test realization. An additional limit L_{CCA_DL} is used to determine the maximum number of unavailable DBT samples within an evaluation window W_{CCA_DL}. If the number of unavailable DBT samples on the last W_{CCA_DL} DBT samples is larger or equal to L_{CCA_DL}, the CCA attempt is considered successful for transmission.

For dynamic channel access configuration, the parameters $P_{CCA_DL_1}$ and $P_{CCA_DL_2}$ are used to configure the probability of CCA success on the first and second SSB candidate positions, respectively, in different time intervals T_i during a test realization. An additional limit L_{CCA_DL} is used to determine the maximum number of unavailable DBT samples within an evaluation window W_{CCA_DL}. If the number of unavailable DBT samples on the last W_{CCA_DL} DBT samples is larger or equal to L_{CCA_DL}, the CCA attempt is considered successful for transmission.

For semi-static channel access configuration or for dynamic channel access configuration where one candidate SSB position is modelled, prior to each discovery burst transmission window within a time interval Ti of the test, the test equipment shall:

1 - Generate a uniform random variable *p1* from the range [0, 1] for the first candidate position.

2 - Transmit the discovery burst based on *p1* in the first candidate position. If $p1 \leq P_{CCA_DL}$, the discovery burst is transmitted at the first candidate SSB location; else if l_{CCA} is larger than or equal to $L_{CCA_DL,}$ the discovery burst is transmitted at the first candidate SSB location, otherwise the discovery burst is muted. If DRX cycle is used, then the decision whether the discover burst is muted or not is repeated for the rest of the DRX cycle.

For dynamic channel access configuration where two candidate SSB positions are modelled, prior to each discovery burst transmission window within a time interval T_i of the test, the test equipment shall:

1 - Generate a uniform random variable *p1* from the range [0, 1] for the first candidate position.

2 - Transmit the discovery burst based on *p1* in the first candidate position: if $p1 \leq P_{CCA_DL1}$, the discovery burst is transmitted at first candidate SSB location, else the test equipment shall:

a - Generate a uniform random variable *p2* from the range [0, 1] for the second candidate SSB position.

b - Transmit the discovery burst based on *p2* in the second candidate position. If $p2 \leq P_{CCA_DL2}$, the discovery burst is transmitted at the second candidate SSB location; else if l_{CCA} is larger than or equal to L_{CCA_DL}, the discovery burst is transmitted at the second candidate SSB location, otherwise the discovery burst is muted. If DRX cycle is used, then the decision whether the discover burst is muted or not is repeated for the rest of the DRX cycle.

The above steps are repeated for each discovery burst transmission window in each time interval T_i of the test. The limit L_{CCA_DL} and window W_{CCA_DL} is a configuration parameter for each test case.

In many test cases, the requirement under a test depends on the number of configured SSB transmissions which are not available during the test due to CCA failure, so the test equipment shall track how many such signal occasions are not transmitted in DL during the test period.

D.7.2.2 UL CCA model

For UL CCA, the modelling approach is based on probability P_{CCA_UL} of successful CCA. Probability P_{CCA_UL} is configured in the corresponding test case, based on a set S_{CCA_UL} of possible values including 75 % and 87% as typical values for dynamic and semi-static channel access configurations, 0% to model consistent UL CCA failures, and 100% to model no UL CCA failures.

Consistent UL CCA failures are modelled by configuring a low value for P_{CCA_UL}, e.g., P_{CCA_UL} = 0%.

In the same time interval T_i during the same test case, P_{CCA_UL} can be different from P_{CCA_DL}.

The probability can be different in different time intervals T_i during a test case. One probability value applies at any time point during a test; one or more probability values can be configured in the entire test, one value P_{CCA_UL} per time interval T_i where $I \geq 1$, and the multiple time intervals (when $I > 1$) do not overlap (e.g., $P_{CCA_UL} = 1.0$ in T_1 and $P_{CCA_UL} = 0.75$ in T_2).

T_{CCA} µs prior to each UL transmission burst in the test, the test equipment (TE) shall generate a uniform random variable p from the range [0, 1]. If $p<P_{CCA_UL}$, the TE transmits an OCNG noise pattern with an energy level X per LBT measurement BW, within the UE BW scheduled/configured for the UL transmission for at-least T_{CCA} µs. Where T_{CCA} µs is energy detection time for accessing the uplink channel as defined in section 5.1.1 of TS 37.106 [36]. Where:

- X is 10.5^{Note1} dB above the energy detection threshold defined in section 5.1.1 of TS 37.106 [36].
- T_{CCA} is the channel sensing period depending on CCA category for the next UL transmission.

The TE shall count the number of UL CCA failures, and no further UL CCA failures are modelled if the number of failures exceeds the limit L_{CCA_UL} within a window W_{CCA_UL}. For each UL CCA failure generated by the model, the TE shall monitor the corresponding UL resource for the desired UL signal and based on when and/or whether the TE received the desired UL signal, it deems the test case to pass or fail.

In many cases, the requirement under a test depends on the number of configured signal occasions which are not available during the test, so the test equipment shall track how many such signal occasions are not transmitted in UL during the test period.

Note1: Includes measurement uncertainty for OCNG noise as defined in Table F.1.1.2-1.

D.7.3 Void

D.8 Test Cases in SA and EN-DC Operations

D.8.0 General

This clause defines a principle which is applicable to test cases verifying RRM requirements in standalone (SA) or EN-DC operations. RRM test cases may be defined in SA and EN-DC operations to verify the same RRM requirement.

The normative reference for this section is TS 38.133 [6] clause A.3.13.

Editor's note: this clause may need to define further for NE-DC and NR-DC test cases, which subjects to the test cases defined in the future.

D.8.1 Principle of testing

If test cases are defined in both SA and EN-DC operations to verify the same RRM requirement then the UE capable of both SA and EN-DC operations needs to verify that RRM requirement by performing test case(s) in either SA operation or in EN-DC operation.

If test cases are defined in both SA and EN-DC operations to verify at least one common RRM requirement then the UE capable of both SA and EN-DC operations needs to verify RRM requirements by performing test case(s) in either SA operation or in EN-DC operation provided that the performed test case(s):

- verifies the largest number of RRM requirements and
- verifies at least all RRM requirements covered in the test case(s), which is not performed.

Annex E (normative): Cell configuration mapping

E.0 General

The cells used in TS 38.533 do not correspond to the cells defined in TS 38.508-1 [14] clause 4.4.2. This annex describes the mapping between the test cases in TS 38.533 and the cells defined in TS 38.508-1 [14]. The test case shall apply the RF parameters as defined in TS 38.533 according to the column heading.

NOTE: For example if the second cell in a test case is an inter-frequency cell then Cell3 from TS 38.508-1 [14] clause 4.4.2 is used with the radio parameters as defined for Cell2 in TS 38.533.

E.1 Test frequency selection

E.1.0 General

The requirements defined in this test specification comprise EN-DC and NR/5GC test cases. The test cases are defined with a single NR cell or with multiple NR cells. The multi-cell test cases can be either intra-frequency, i.e. the NR cells defined by the test are overlapping in the frequency domain, or inter-frequency, i.e. the NR cells defined by the test have different centre frequencies, separated from each other by a frequency value bigger than the respective cell bandwidths. This clause describes the general rule on how to select the test frequencies for the NR RRM test cases in this test specification.

E.1.1 E-UTRA PCell for EN-DC test cases

Unless otherwise stated, the E-UTRA PCell for EN-DC test cases shall be configured using the test frequency “Mid” as defined in TS 36.508 [25] for the corresponding E-UTRA band.

In case that the “Mid” test frequency overlaps with any of the NR test frequencies required by the test case, the E-UTRA PCell shall be shifted to an additional frequency within the E-UTRA same band. If the E-UTRA band channel bandwidth is not sufficient to allocate a non-overlapping E-UTRA PCell, the auxiliary band as defined in TS 36.521-3 [26] clause 3 shall be used.

E.1.2 Test cases with one NR cell

Unless otherwise stated, for NR test cases with one NR cell, this cell shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding band under test.

E.1.3 Test cases with more than one NR cell

E.1.3.1 Intra-frequency test cases

Unless otherwise stated, multi-cell intra-frequency test cases shall be tested using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding NR band under test.

E.1.3.2 Inter-frequency test cases

For NR/5GC and EN-DC multi-cell inter-frequency test cases in FR1, unless otherwise stated, the serving cell shall be configured using the test frequency “Low” as defined in TS 38.508-1 [14] for the corresponding band under test. Any inter-frequency neighbour cell shall be configured using the test frequency “High” as defined in TS 38.508-1 [14] for the corresponding band under test. For the 2nd inter-frequency neighbour cell shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding band under test.

For NR/5GC multi-cell inter-frequency test cases in FR2, unless otherwise stated, the serving cell (and any other neighbour cell in the same frequency carrier) shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14], clause 7.2.3.2 for the corresponding band under test. Any inter-frequency neighbour cell shall be configured using a non-overlapping test frequency adjacent to the serving cell frequency, as defined in TS 38.508-1 [14], clause 7.2.3.2.

For EN-DC multi-cell inter-frequency test cases in FR2, unless otherwise stated, the PSCell (and any other neighbour cell in the same frequency carrier) shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] , clause 7.2.3.2 for the corresponding band under test. Any inter-frequency neighbour cell shall be configured using a non-overlapping test frequency adjacent to the PSCell frequency, as defined in TS 38.508-1 [14] , clause 7.2.3.2.

E.1.4 Carrier aggregation test cases

E.1.4.1 Inter-band carrier aggregation

For inter-band carrier aggregation test cases, each of the component carriers and their respective neighbour cells shall be configured following the same principles defined in E.1.2 and E.1.3.

E.1.4.2 Intra-band contiguous carrier aggregation

For intra-band contiguous carrier aggregation with 2 CCs in FR1, unless otherwise specified, the serving cells (and any other neighbour cell(s) in the same frequency carriers) shall be configured using the test frequency “Low” as defined in TS 38.508-1 [14], subclause 4.3.1.1.3 for the corresponding band under test (SpCC = CC1 and SCC = CC2).

For intra-band contiguous carrier aggregation with 2 CCs in FR2, unless otherwise specified, the serving cells (and any other neighbour cell(s) in the same frequency carriers) shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14], subclause 7.2.3.4 for the corresponding band under test (SpCC = CC1 and SCC = CC2).

E.1.4.3 Intra-band non-contiguous carrier aggregation

For intra-band non-contiguous carrier aggregation in FR1, unless otherwise specified, the test frequency selection shall be done following the maximum Wgap principle, i.e. selecting the test frequencies (of the test frequencies defined in TS 38.508-1 [14]) with the widest frequency separation within the band under test.

For intra-band non-contiguous carrier aggregation in FR2, the test frequency selection is TBD.

E.1.5 E-UTRA – NR inter RAT test cases

Unless otherwise stated, the E-UTRA serving/neighbour cell for E-UTRA – NR inter-RAT test cases shall be configured using the test frequency “Mid” as defined in TS 36.508 [25] for the corresponding E-UTRA band.

In case that the “Mid” test frequency overlaps with any of the NR test frequencies required by the test case, the E-UTRA cell shall be shifted to an additional frequency within the E-UTRA same band. If the E-UTRA band channel bandwidth is not sufficient to allocate a non-overlapping E-UTRA cell, the auxiliary band as defined in TS 36.521-3 [26] clause 3 shall be used.

E.1.6 Intra-band EN-DC test cases

E.1.6.1 Intra-band non-contiguous EN-DC

For intra-band non-contiguous EN-DC in FR1, unless otherwise specified, the test frequency selection shall be done following the maximum Wgap principle, i.e. selecting the test frequencies (of the test frequencies defined in TS 38.508-1 [14]) with the widest frequency separation within the band under test.

E.1.6.1.1 Inter-frequency neighbour cell

Unless otherwise stated, any inter-frequency neighbour cell shall be configured using the test frequency “Mid” as defined in TS 38.508-1 [14] for the corresponding NR band under test. If the NR band channel bandwidth is not sufficient to allocate a non-overlapping the neighbour cell, the auxiliary band as defined in TBD shall be used.

E.1.6.2 Intra-band contiguous EN-DC

E.1.6.1.1 E-UTRA PCell

Unless otherwise stated, the E-UTRA PCell for intra-band contiguous EN-DC test cases shall be configured using same test frequency, e.g., “Mid” as for NR PSCell as defined in TS 38.508-1 [14].

E.1.7 NR sidelink test cases

Unless otherwise stated, for NR sidelink test cases the NR sidelink carrier shall be configured using the test frequency "Mid" as defined in TS 38.508-1 [14] for the corresponding band under test.

For con-current operation, unless otherwise stated, each of the NR Uu carriers and their respective cells shall be configured following the sample principles defined in E.1.2 and E.1.3.

E.2 Cell configuration mapping for EN-DC FR1 test cases in Chapter 4

Table E.2-1 defines the cell configuration mapping for EN-DC FR1 test cases in chapter 4 of this test specification.

Annex F (normative): Measurement uncertainties and test tolerances

The requirements of this clause apply to all tests in the present document.

F.1 Measurement uncertainties and test tolerances for FR1 and FR2

F.1.1 Acceptable uncertainty of test system (normative)

See TS 38.521-1 [17] annex F.1.

F.1.1.1 Measurement of test environments

See TS 38.521-1 [17] Annex F1.1.

F.1.1.2 Measurement of RRM requirements

This clause defines the maximum test system uncertainty for the RRM requirements. The maximum uncertainty values allowed for the typical RRM measurement uncertainty contributors is defined in Table F.1.1.2-1 and Table F.1.1.2-2. Unless explicitly stated for a particular test case, these maximum uncertainty values should be used as starting point to perform the test tolerance analysis in TR 38.903 [22] for each of the test cases. Specific test cases might require a tighter measurement uncertainty value for some of the contributors. Exceptions to the general values in Table F.1.1.2-1 and Table F.1.1.2-2 shall be handled case by case.

6.5.8.1 UE specific CBW change on PCell in FR1 in non-DRX	Test System uncertainty on Cell1: ±0.6 dB	Overall system uncertainty for AWGN conditions comprises two quantities: 1. Signal-to-noise ratio uncertainty: ±0.3 dB, 2. Effect of AWGN flatness and signal flatness: ±2.0 dB. Items 1 and 2 are assumed to be uncorrelated so can be root sum squared: AWGN flatness and signal flatness has x 0.25 effect on the required SNR, so use sensitivity factor of x 0.25 for the uncertainty contribution. Test System uncertainty = SQRT (Signal-to-noise ratio uncertainty^2 + (0.25 x AWGN flatness and signal flatness)^2) = 0.58dB, round up to 0.6dB.

F.1.3.2 Measurement of RRM requirements

Because the relationships between the test system uncertainties and the test tolerances are often complex, it is not always possible to give a simple derivation of the test requirement in this document. The analysis is recorded in 3GPP TR 38 903 [22].

The derivation of the test requirements for the EN-DC FR1 test cases in chapter 4 is defined in Table F.1.3.2-1.

The derivation of the test requirements for the NE-DC FR1 test cases in chapter 4 is defined in Table F.1.3.2-1a.

The derivation of the test requirements for the NR/5GC FR1 test cases in chapter 6 is defined in Table F.1.3.2-2.

The derivation of the test requirements for the EN-DC FR2 test cases in chapter 5 is defined in Table F.1.3.2-3.

The derivation of the test requirements for the NR/5GC FR2 test cases in chapter 7 is defined in Table F.1.3.2-4.

The derivation of the test requirements for the E-UTRA – NR inter-RAT with E-UTRA serving cell test cases in chapter 8 is defined in Table F.1.3.2-5.

The derivation of the test requirements for the FR1 NR sidelink test cases in chapter 9 is defined in Table F.1.3.2-6.

The derivation of the test requirements for the EN-DC FR1 test cases for shared spectrum in chapter 10 is defined in Table F.1.3.2-10.

The derivation of the test requirements for the NR/5GC FR1 test cases for shared spectrum in chapter 11 is defined in Table F.1.3.2-11.

The derivation of the test requirements for the E-UTRA – NR inter-RAT with E-UTRA serving cell test cases for shared spectrum in chapter 12 is defined in Table F.1.3.2-12.

The derivation of the test requirements for the NR/5GC FR1 test cases with SCell in shared spectrum in chapter 13 is defined in Table F.1.3.2-13.

The derivation of the test requirements for SA FR1 Satellite access test cases in chapter 14 is defined in Table F.1.3.2-14.

The derivation of the test requirements for the NR/5GC FR1 test cases for RedCap in chapter 16 is defined in Table F.1.3.2-7.

The derivation of the test requirements for the NR/5GC FR2 test cases for RedCap in chapter 17 is defined in Table F.1.3.2-8.

The derivation of the test requirements for the E-UTRA – NR inter-RAT with E-UTRA serving cell test cases for RedCap in chapter 18 is defined in Table F.1.3.2-9.

The derivation of the test requirements for the NR/5GC FR1 test cases for ATG in chapter 19 is defined in Table F.1.3.2-15.
